|================================================================================
|
| This section gives a general overview of the remainder of this document.
|
| Sections 2 and 3 contain general information about the IBIS versions and the
| general rules and guidelines.  Several progressions of IBIS documents are
| referenced in Section 2 and in the discussion below.  They are IBIS Version
| 1.1 (ratified August 1993), IBIS Version 2.1 (ratified as ANSI/EIA-656 in
| December 1995), IBIS Version 3.2 (ratified as ANSI/EIA-656-A in October
| 1999), IBIS Version 4.0 (ratified in July 2002), and this document, IBIS
| Version 4.1 (ratified in August 2003).
|
| The functionality of IBIS follows in Sections 4 through 8.  Sections 4
| through 6 describe the format of the core functionality of IBIS Version 1.1
| and the extensions in later versions.  The data in these sections are
| contained in .ibs files.  Section 7 describes the package model format of
| IBIS Version 2.1 and a subsequent extension.  Package models can be
| formatted within .ibs files or can be formatted (along with the Section 4
| file header keywords) as .pkg files.  Section 8 contains the Electrical
| Board Description format of IBIS Version 3.2.  Along with Section 4 header
| information, electrical board descriptions must be described in separate
| .ebd files.
|
| Section 9 contains some notes regarding the extraction conditions and data
| requirements for IBIS files.  This section focuses on implementation
| conditions based on measurement or simulation for gathering the IBIS
| compliant data.

|
```

In order to enable an industry standard method to electronically transport
IBIS Modeling Data between semiconductor vendors, EDA tool vendors, and end
customers, this template is proposed. The intention of this template is to
specify a consistent format that can be parsed by software, allowing EDA
tool vendors to derive models compatible with their own products.

One goal of this template is to represent the current state of IBIS data,
while allowing a growth path to more complex models / methods (when deemed
appropriate). This would be accomplished by a revision of the base
template, and possibly the addition of new keywords or categories.

Another goal of this template is to ensure that it is simple enough for
semiconductor vendors and customers to use and modify, while ensuring that
it is rigid enough for EDA tool vendors to write reliable parsers.

Finally, this template is meant to contain a complete description of the I/O
elements on an entire component. Consequently, several models will need to
be defined in each file, as well as a table that equates the appropriate
buffer to the correct pin and signal name.

Version 4.0 of this electronic template was finalized by an industry-wide
group of experts representing various companies and interests. Regular
"EIA IBIS Open Forum" meetings were held to accomplish this task.

Commitment to Backward Compatibility. Version 1.0 is the first valid IBIS
ASCII file format. It represents the minimum amount of I/O buffer
information required to create an accurate IBIS model of common CMOS and
bipolar I/O structures. Future revisions of the ASCII file will add items
considered to be "enhancements" to Version 1.0 to allow accurate modeling
of new, or other I/O buffer structures. Consequently, all future revisions
will be considered supersets of Version 1.0, allowing backward
compatibility. In addition, as modeling platforms develop support for
revisions of the IBIS ASCII template, all previous revisions of the template
must also be supported.

Version 1.1 update. The file "ver1_1.ibs" is conceptually the same as the
1.0 version of the IBIS ASCII format (ver1_0.ibs). However, various
comments have been added for further clarification.

Version 2.0 update. The file "ver2_0.ibs" maintains backward compatibility
with Versions 1.0 and 1.1. All new keywords and elements added in Version
2.0 are optional. A complete list of changes to the specification is in the
IBIS Version 2.0 Release Notes document ("ver2_0.rn.txt").

Version 2.1 update. The file "ver2_1.ibs" contains clarification text
changes, corrections, and two additional waveform parameters beyond Version
2.0.

| Version 3.0 update. The file "ver3_0.ibs" adds a number of new keywords and
| functionality. A complete list of functions can be found on eda.org under
| /pub/ibis/birds/birddir.txt showing the approved Buffer Issue Resolution
| Documents (BIRDs) that have been approved for Version 3.0.
|
| Version 3.1 update. The file "ver3_1.ibs" contains a major reformatting of
| the document and a simplification of the wording. It also contains some new
| technical enhancements that were unresolved when Version 3.0 was approved.
|
| Version 3.2 update. The file "ver3_2.ibs" adds more technical advances and
| also a number of editorial changes documented in 12 BIRDs and also in
| responses to public letter ballot comments.
|
| Version 4.0 update. This file "ver4_0.ibs" adds more technical advances and
| a few editorial changes documented in 11 BIRDs.
|
| Version 4.1 update. This file "ver4_1.ibs adds more technical advances and
| a few editorial changes documented in 5 BIRDs.

|
|===============================================================================
|===============================================================================
|
| This section contains general syntax rules and guidelines for ASCII IBIS
| files:
|
| 1)   The content of the files is case sensitive, except for reserved
|      words and keywords.
|
| 2)   The following words are reserved words and must not be used for
|      any other purposes in the document:
|           POWER - reserved model name, used with power supply pins,
|           GND   - reserved model name, used with ground pins,
|           NC    - reserved model name, used with no-connect pins,
|           NA    - used where data not available,
|           CIRCUITCALL - used for circuit call references in Section 6b.
|
| 3)   To facilitate portability between operating systems, file names used in
|      the IBIS file must only have lower case characters.  File names should
|      have a basename of no more than twenty characters followed by a period
|      ('.') , followed by a file name extension of no more than three
|      characters.  The file name and extension must use characters from the
|      set (space, ' ', 0x20 is not included):
|
|           a b c d e f g h i j k l m n o p q r s t u v w x y z
|           0 1 2 3 4 5 6 7 8 9 _ ^ $ ~ ! # % & - { } ) ( @ ' `
|
|      The file name and extension are recommended to be lower case on
|      systems that support such names.
|
| 4)   A line of the file may have at most 120 characters, followed by a line
|      termination sequence.  The line termination sequence must be one of the
|      following two sequences: a linefeed character, or a carriage return
|      followed by linefeed character.
|
| 5)   Anything following the comment character is ignored and considered a
|      comment on that line.  The default "|" (pipe) character can be changed
|      by the keyword [Comment Char] to any other character. The [Comment Char]
|      keyword can be used throughout the file as desired.
|
| 6)   Keywords must be enclosed in square brackets, [], and must start in
|      column 1 of the line.  No space or tab is allowed immediately after the
|      opening bracket '[' or immediately before the closing bracket ']'.  If
|      used, only one space (' ') or underscore ('_') character separates the
|      parts of a multi-word keyword.
|
| 7)   Underscores and spaces are equivalent in keywords.  Spaces are not
|      allowed in subparameter names.
|
| 8)   Valid scaling factors are:
|           T = tera        k = kilo         n = nano
```

```
|        G = giga        m = milli       p = pico
|        M = mega        u = micro       f = femto
|    When no scaling factors are specified, the appropriate base units are
|    assumed.  (These are volts, amperes, ohms, farads, henries, and
|    seconds.)  The parser looks at only one alphabetic character after a
|    numerical entry, therefore it is enough to use only the prefixes to
|    scale the parameters.  However, for clarity, it is allowed to use full
|    abbreviations for the units, (e.g., pF, nH, mA, mOhm).  In addition,
|    scientific notation IS allowed (e.g., 1.2345e-12).
|
| 9)  The I-V data tables should use enough data points around sharply curved
|     areas of the I-V curves to describe the curvature accurately.  In linear
|     regions there is no need to define unnecessary data points.
|
| 10) The use of tab characters is legal, but they should be avoided as much
|     as possible.  This is to eliminate possible complications that might
|     arise in situations when tab characters are automatically converted to
|     multiple spaces by text editing, file transferring and similar software.
|     In cases like that, lines might become longer than 120 characters, which
|     is illegal in IBIS files.
|
| 11) Currents are considered positive when their direction is into the
|     component.
|
| 12) All temperatures are represented in degrees Celsius.
|
| 13) Important supplemental information is contained in the last section,
|     "NOTES ON DATA DERIVATION METHOD", concerning how data values are
|     derived.
|
| 14) Only ASCII characters, as defined in ANSI Standard X3.4-1986, may be
|     used in an IBIS file.  The use of characters with codes greater than
|     hexadecimal 07E is not allowed.  Also, ASCII control characters
|     (those numerically less than hexadecimal 20) are not allowed, except
|     for tabs or in a line termination sequence. As mentioned in item 10
|     above, the use of tab characters is discouraged.
|

|
```

Section 4

```
|
|              F I L E   H E A D E R   I N F O R M A T I O N
|
|================================================================================
|================================================================================
|        Keyword:   [IBIS Ver]
|       Required:   Yes
| Description:   Specifies the IBIS template version.  This keyword informs
|                electronic parsers of the kinds of data types that are
|                present in the file.
| Usage Rules:   [IBIS Ver] must be the first keyword in any IBIS file.  It is
|                normally on the first line of the file, but can be preceded
|                by comment lines that must begin with a "|".
|--------------------------------------------------------------------------------
[IBIS Ver]      4.1                       | Used for template variations
|
|================================================================================
|        Keyword:   [Comment Char]
|       Required:   No
| Description:   Defines a new comment character to replace the default
|                "|" (pipe) character, if desired.
| Usage Rules:   The new comment character to be defined must be followed by
|                the underscore character and the letters "char".  For example:
|                "|_char" redundantly redefines the comment character to be
|                the pipe character.  The new comment character is in effect
|                only following the [Comment Char] keyword.  The following
|                characters MAY be used:
|
|                   ! " # $ % & ' ( ) * , : ; < > ? @ \ ^ ` { | } ~
|
| Other Notes:   The [Comment Char] keyword can be used throughout the file, as
|                desired.
|--------------------------------------------------------------------------------
[Comment Char]  |_char
|
|================================================================================
|        Keyword:   [File Name]
|       Required:   Yes
| Description:   Specifies the name of the IBIS file.
| Usage Rules:   The file name must conform to the rules in paragraph 3 of
|                Section 3, GENERAL SYNTAX RULES AND GUIDELINES.  In addition,
|                the file name must use the extension ".ibs", ".pkg", or
|                or ".ebd".  The file name must be the actual name of the file.
|--------------------------------------------------------------------------------
[File Name]     ver4_1.ibs
|
|================================================================================
|        Keyword:   [File Rev]
|       Required:   Yes
| Description:   Tracks the revision level of a particular .ibs file.
| Usage Rules:   Revision level is set at the discretion of the engineer
|                defining the file.  The following guidelines are recommended:
|                     0.x     silicon and file in development
|                     1.x     pre-silicon file data from silicon model only
```

```
|                     2.x     file correlated to actual silicon measurements
|                     3.x     mature product, no more changes likely
|-----------------------------------------------------------------------------
[File Rev]      1.0                       | Used for .ibs file variations
|
|
|=============================================================================
|    Keywords:  [Date], [Source], [Notes], [Disclaimer], [Copyright]
|    Required:  No
| Description:  Optionally clarifies the file.
| Usage Rules:  The keyword arguments can contain blanks, and be of any
|               format.  The [Date] keyword argument is limited to a maximum
|               of 40 characters, and the month should be spelled out for
|               clarity.
|
|               Because IBIS model writers may consider the information in
|               these keywords essential to users, and sometimes legally
|               required, design automation tools should make this information
|               available.  Derivative models should include this text
|               verbatim.  Any text following the [Copyright] keyword must be
|               included in any derivative models verbatim.
|-----------------------------------------------------------------------------
[Date]          August 1, 2003           | The latest file revision date
|
[Source]        Put originator and the source of information here.  For
                example:

                From silicon level SPICE model at Intel.
                From lab measurement at IEI.
                Compiled from manufacturer's data book at Quad Design, etc.
|
[Notes]         Use this section for any special notes related to the file.
|
[Disclaimer]    This information is for modeling purposes only, and is not
                guaranteed.                           | May vary by component
|

|
                              Section 5
|
|             C O M P O N E N T    D E S C R I P T I O N
|
|==============================================================================
|==============================================================================
|       Keyword:   [Component]
|      Required:   Yes
|  Description:   Marks the beginning of the IBIS description of the integrated
|                 circuit named after the keyword.
|  Sub-Params:    Si_location, Timing_location
|  Usage Rules:   If the .ibs file contains data for more than one component,
|                 each section must begin with a new [Component] keyword.  The
|                 length of the component name must not exceed 40 characters,
|                 and blank characters are allowed.
|
|                 NOTE: Blank characters are not recommended due to usability
|                 issues.
|
|                 Si_location and Timing_location are optional and specify where
|                 the Signal Integrity and Timing measurements are made for the
|                 component.  Allowed values for either subparameter are 'Die'
|                 or 'Pin'.  The default location is at the 'Pin'.
|------------------------------------------------------------------------------
[Component]      7403398 MC452
|
Si_location     Pin     | Optional subparameters to give measurement
Timing_location Die     | location positions
|
|==============================================================================
|       Keyword:   [Manufacturer]
|      Required:   Yes
|  Description:   Specifies the name of the component's manufacture.
|  Usage Rules:   The length of the manufacturer's name must not exceed 40
|                 characters (blank characters are allowed, e.g., Texas
|                 Instruments).  In addition, each manufacturer must use a
|                 consistent name in all .ibs files.
|------------------------------------------------------------------------------
[Manufacturer]   Intel Corp.
|
|==============================================================================
|       Keyword:   [Package]
|      Required:   Yes
|  Description:   Defines a range of values for the default packaging
|                 resistance, inductance, and capacitance of the component pins.
|  Sub-Params:    R_pkg, L_pkg, C_pkg
|  Usage Rules:   The typical (typ) column must be specified.  If data for the
|                 other columns are not available, they must be noted with "NA".
|  Other Notes:   If RLC parameters are available for individual pins, they can
|                 be listed in columns 4-6 under keyword [Pin].  The values
|                 listed in the [Pin] description section override the default
|                 values defined here.  Use the [Package Model] keyword for more
|                 complex package descriptions.  If defined, the [Package Model]
|                 data overrides the values in the [Package] keyword.
|                 Regardless, the data listed under the [Package] keyword must
```

```
|              still contain valid data.
|------------------------------------------------------------------------------
[Package]
| variable      typ             min             max
R_pkg          250.0m          225.0m          275.0m
L_pkg          15.0nH          12.0nH          18.0nH
C_pkg          18.0pF          15.0pF          20.0pF
|
|==============================================================================
|    Keyword:  [Pin]
|   Required:  Yes
| Description: Associates the component's I/O models to its various external
|              pin names and signal names.
| Sub-Params: signal_name, model_name, R_pin, L_pin, C_pin
| Usage Rules: All pins on a component must be specified.  The first column
|              must contain the pin name.  The second column, signal_name,
|              gives the data book name for the signal on that pin.  The
|              third column, model_name, maps a pin to a specific I/O buffer
|              model or model selector name.  Each model_name must have a
|              corresponding model or model selector name listed in a [Model]
|              or [Model Selector] keyword below, unless it is a reserved
|              model name (POWER, GND, or NC).
|
|              The model_name column cannot be used for model or model
|              selector names that reference Series and Series_switch models.
|
|              Each line must contain either three or six columns.  A pin
|              line with three columns only associates the pin's signal and
|              model.  Six columns can be used to override the default
|              package values (specified under [Package]) FOR THAT PIN ONLY.
|              When using six columns, the headers R_pin, L_pin, and C_pin
|              must be listed.  If "NA" is in columns 4 through 6, the
|              default packaging values must be used.  The headers R_pin,
|              L_pin, and C_pin may be listed in any order.
|
|              Column length limits are:
|                  [Pin]          5 characters max
|                  model_name    20 characters max
|                  signal_name   20 characters max
|                  R_pin          9 characters max
|                  L_pin          9 characters max
|                  C_pin          9 characters max
|------------------------------------------------------------------------------
[Pin]   signal_name     model_name      R_pin   L_pin   C_pin
|

|==============================================================================
|      Keyword:  [Package Model]
|     Required:  No
| Description:  Indicates the name of the package model to be used for the
|               component.
| Usage Rules:  The package model name is limited to 40 characters.  Spaces
|               are allowed in the name.  The name should include the company
|               name or initials to help ensure uniqueness.  The EDA tool
|               will search for a matching package model name as an argument
|               to a [Define Package Model] keyword in the current IBIS file
|               first.  If a match is not found, the EDA tool will next look
|               for a match in an external .pkg file.  If the matching package
|               model is in an external .pkg file, it must be located in the
|               same directory as the .ibs file.  The file names of .pkg files
|               must follow the rules for file names given in Section 3,
|               GENERAL SYNTAX RULES AND GUIDELINES.
| Other Notes:  Use the [Package Model] keyword within a [Component] to
|               indicate which package model should be used for that
|               component.  The specification permits .ibs files to contain
|               [Define Package Model] keywords as well.  These are described
|               in the "Package Modeling" section near the end of this
|               specification.  When package model definitions occur within a
|               .ibs file, their scope is "local", i.e., they are known only
|               within that .ibs file and no other.  In addition, within that
|               .ibs file, they override any globally defined package models
|               that have the same name.
|------------------------------------------------------------------------------
[Package Model]     QS-SMT-cer-8-pin-pkgs
|
|==============================================================================
|     Keywords:  [Alternate Package Models], [End Alternate Package Models]
|     Required:  No
| Description:  Used to select a package model from a list of package models.
| Usage Rules:  The [Alternate Package Models] keyword can be used in addition
|               to the [Package Model] keyword.  [Alternate Package Models]
|               shall be used only for components that use the [Package Model]
|               keyword.
|
|               Each [Alternate Package Models] keyword specifies a set of
|               alternate package model names for only one component, which
|               is given by the previous [Component] keyword.  The [Alternate
|               Package Models] keyword shall not appear before the first
|               [Component] keyword in an IBIS file.  The [Alternate Package
|               Models] keyword applies only to the [Component] section in
|               which it appears, and must be followed by an [End Alternate
|               Package Models] keyword.
|
|               All alternate package model names must appear below the
|               [Alternate Package Models] keyword, and above the following
|               [End Alternate Package Models] keyword.  The package model
```

```
|                    names listed under the [Alternate Package Models] must follow
|                    the rules of the package model names associated with the
|                    [Package Model] keyword.  The package model names correspond
|                    to the names of package models defined by [Define Package
|                    Model] keywords.  EDA tools may offer users a facility
|                    for choosing between the default package model and any of the
|                    alternate package models, when analyzing occurances of the
|                    [Component].
|
|                    The package model named by [Package Model] can be optionally
|                    repeated in the [Alternate Package Models] list of names.

|
|=============================================================================
|        Keyword:   [Pin Mapping]
|       Required:   No
|    Description:   Used to indicate the power and/or ground buses to which a
|                   givne driver, receiver or terminator is connected.
|    Sub-Params:    pulldown_ref, pullup_ref, gnd_clamp_ref, power_clamp_ref,
|                   ext_ref
|    Usage Rules:   The [Pin Mapping] keyword names the connections between POWER
|                   and/or GND pins and buffer and/or terminator voltage supply
|                   references using unique bus labels.  All buses with identical
|                   labels are assumed to be connected with an ideal short.  Each
|                   label must be associated with at least one pin whose
|                   model_name is POWER or GND.  Bus labels must not exceed 15
|                   characters.
|
|                   Each line must contain either three, five or six entries.
|                   Use the reserved word NC where an entry is required but a bus
|                   connection is not made (see below).
|
|                   The first column contains a pin name.  Each pin name must
|                   match one of the pin names declared in the [Pin] section of
|                   the [Component].
|
|                   For buffers and terminators, the remaining columns correspond
|                   to the voltage supply references for the named pin.  Each
|                   [Model] supply reference is connected to a particular bus
|                   through a bus label in the corresponding column.
|
|                   The second column, pulldown_ref, designates the ground bus
|                   connections for the buffer or termination associated with that
|                   pin.  The bus named under pulldown_ref is associated with the
|                   [Pulldown] I-V table for non-ECL [Model]s.  This is also the
|                   bus associated with the [GND Clamp] I-V table and the [Rgnd]
|                   model unless overridden by a label in the gnd_clamp_ref
|                   column.
|
|                   The third column, pullup_ref, designates the power bus
```

```
|                    connection for the buffer or termination.  The bus named under
|                    pullup_ref is associated with the [Pullup] table for non-ECL
|                    [Model]s (for ECL models, this bus is associated with the
|                    [Pulldown] table).  This is also the bus label associated with
|                    the [POWER Clamp] I-V table and the Rpower] model unless
|                    overridden by a label in the power_clamp_ref column.
|
|                    The fourth and fifth columns, gnd_clamp_ref and
|                    power_clamp_ref, contain entries, if needed, to specify
|                    additional ground bus and power bus connections for clamps.
|                    Finally, the sixth column, ext_ref, contains entries to
|                    specify external reference supply bus connections.
|
|                    The usage of the columns changes for GND and POWER pins.  For
|                    GND pins, the pulldown_ref column contains the name of the bus
|                    to which the pin connects; the pullup_ref column in this case
|                    must contain the reserved word NC.  Similarly, for POWER
|                    (including external reference) pins, the pullup_ref column
|                    contains the name of the bus to which the pin connects; the
|                    pulldown_ref column in this case must contain the reserved
|                    word NC.
|
|                    If the [Pin Mapping] keyword is present, then the bus
|                    connections for EVERY pin listed under the [Pin] keyword must
|                    be given.
|
|                    If a pin has no connection, then both the pulldown_ref and
|                    pullup_ref subparameters for it will be NC.
|
|                    The column length limits are:
|                            [Pin Mapping]     5 characters max
|                            pulldown_ref     15 characters max
|                            pullup_ref       15 characters max
|                            gnd_clamp_ref    15 characters max
|                            power_clamp_ref  15 characters max
|                            ext_ref          15 characters max
|
|                    For compatibility with models developed under previous IBIS
|                    versions, [Pin Mapping] lines which contain ext_ref column
|                    entries must also explicitly include entries for the
|                    pulldown_ref, pullup_ref, gnd_clamp_ref and power_clamp_ref
|                    columns.  These entries can be NC, as explained above.
|
|                    When six columns of data are specified, the headings
|                    gnd_clamp_ref, power_clamp_ref and ext_ref must be used on
|                    the line containing the [Pin Mapping] keyword.  Otherwise,
|                    these headings can be omitted.

```
|==============================================================================
|      Keyword:   [Diff Pin]
|     Required:   No
|  Description:   Associates differential pins, their differential threshold
|                 voltages, and differential timing delays.
|  Sub-Params:   inv_pin, vdiff, tdelay_typ, tdelay_min, tdelay_max
| Usage Rules:   Enter only differential pin pairs.  The first column, [Diff
|                Pin], contains a non-inverting pin name.  The second column,
|                inv_pin, contains the corresponding inverting pin name for
|                I/O output.  Each pin name must match the pin names declared
|                previously in the [Pin] section of the IBIS file.  The third
|                column, vdiff, contains the specified output and differential
|                threshold voltage between pins if the pins are Input or I/O
|                model types.  For output only differential pins, the vdiff
|                entry is 0 V.  The fourth, fifth, and sixth columns,
|                tdelay_typ, tdelay_min, and tdelay_max, contain launch delays
|                of the non-inverting pins relative to the inverting pins. The
|                values can be of either polarity.
|
|                If a pin is a differential input pin, the differential input
|                threshold (vdiff) overrides and supersedes the need for Vinh
|                and Vinl.
|
|                If vdiff is not defined for a pin that is defined as requiring
|                a Vinh by its [Model] type, vdiff is set to the default value
|                of 200 mV.
|
| Other Notes:  The output pin polarity specification in the table overrides
|                the [Model] Polarity specification such that the pin in the
|                [Diff Pin] column is Non-Inverting and the pin in the inv_pin
|                column is Inverting.  This convention enables one  [Model] to
|                be used for both pins.
|
|                The column length limits are:
|                    [Diff Pin]    5 characters max
|                    inv_pin       5 characters max
|                    vdiff         9 characters max
|                    tdelay_typ    9 characters max
|                    tdelay_min    9 characters max
|                    tdelay_max    9 characters max
|
|                Each line must contain either four or six columns.  If "NA" is
|                entered in the vdiff, tdelay_typ, or tdelay_min columns, its
|                entry is interpreted as 0 V or 0 ns.  If "NA" appears in the
|                tdelay_max column, its value is interpreted as the tdelay_typ
|                value.  When using six columns, the headers tdelay_min and
|                tdelay_max must be listed.  Entries for the tdelay_min column
|                are based on minimum magnitudes; and tdelay_max column,
|                maximum magnitudes.  One entry of vdiff, regardless of its
|                polarity, is used for difference magnitudes.
|------------------------------------------------------------------------------

                                                | * Could be Input or I/O with vdiff = 0
  |
  |==============================================================================
  |     Keyword:    [Series Pin Mapping]
  |    Required:    No
  | Description:    Used to associate two pins joined by a series model.
  |  Sub-Params:    pin_2, model_name, function_table_group
  | Usage Rules:    Enter only series pin pairs.  The first column, [Series Pin
  |                 Mapping], contains the series pin for which input impedances
  |                 are measured.  The second column, pin_2, contains the other
  |                 connection of the series model.  Each pin must match the pin
  |                 names declared previously in the [Pin] section of the IBIS
  |                 file.  The third column, model_name, associates the Series or
  |                 Series_switch model for the pair of pins in the first two
  |                 columns.  The fourth column, function_table_group, contains
  |                 an alphanumeric designator string to associate those sets of
  |                 Series_switch pins that are switched together.
  |
  |                 Each line must contain either three or four columns.  When
  |                 using four columns, the header function_table_group must be
  |                 listed.
  |
  |                 One possible application is to model crossbar switches where
  |                 the straight through On paths are indicated by one designator
  |                 and the cross over On paths are indicated by another
  |                 designator.  If the model referenced is a Series model, then
  |                 the function_table_group entry is omitted.
  |
  |                 The column length limits are:
  |                     [Series Pin Mapping]       5 characters max
  |                     pin_2                      5 characters max
  |                     model_name                20 characters max
  |                     function_table_group      20 characters max
  |
  | Other Notes:    If the model_name is for a non-symmetrical series model,
  |                 then the order of the pins is important.  The [Series Pin
  |                 Mapping] and pin_2 entries must be in the columns that
  |                 correspond with Pin 1 and Pin 2 of the referenced model.
  |
  |                 This mapping covers only the series paths between pins.  The
  |                 package parasitics and any other elements such as additional
  |                 capacitance or clamping circuitry are defined by the
  |                 model_name that is referenced in the [Pin] keyword.  The
  |                 model_names under the [Pin] keyword that are also referenced
  |                 by the [Series Pin Mapping] keyword may include any legal
  |                 model or reserved model except for Series and Series_switch
  |                 models.  Normally the pins will reference a [Model] whose
  |                 Model_type is 'Terminator'.  For example, a Series_switch
  |                 model may contain Terminator models on EACH of the pins to
  |                 describe both the capacitance on each pin and some clamping
  |                 circuitry that may exist on each pin.  In a similar manner,
  |                 Input, I/O or Output models may exist on each pin of a Series
  |                 model that is serving as a differential termination.
  |------------------------------------------------------------------------------

|
|=============================================================================
|      Keyword:   [Series Switch Groups]
|     Required:   No
|  Description:   Used to define allowable switching combinations of series
|                 switches described using the names of the groups in the
|                 [Series Pin Mapping] keyword function_table_group column.
|   Sub-Params:   On, Off
|  Usage Rules:   Each state line contains an allowable configuration.  A
|                 typical state line will start with 'On' followed by all of the
|                 on-state group names or an 'Off' followed by all of the
|                 off-state group names.  Only one of 'On' or 'Off' is required
|                 since the undefined states are presumed to be opposite of the
|                 explicitly defined states.  The state line is terminated with
|                 the slash '/', even if it extends over several lines to fit
|                 within the 80 character column width restriction.
|
|                 The group names in the function_table_group are used to
|                 associate switches whose switching action is synchronized by
|                 a common control function.  The first line defines the assumed
|                 (default) state of the set of series switches.  Other sets of
|                 states are listed and can be selected through a user interface
|                 or through automatic control.
|-----------------------------------------------------------------------------

Off 5 6 /                     | Crossbar open switches
|
|==============================================================================
|      Keyword:    [Model Selector]
|     Required:    No
|  Description:    Used to pick a [Model] from a list of [Model]s for a pin which
|                  uses a programmable buffer.
|  Usage Rules:    A programmable buffer must have an individual [Model] section
|                  for each one of its modes used in the .ibs file.  The names of
|                  these [Model]s must be unique and can be listed under the
|                  [Model Selector] keyword and/or pin list.  The name of the
|                  [Model Selector] keyword must match the corresponding model
|                  name listed under the [Pin] or [Series Pin Mapping] keyword
|                  and must not contain more than 20 characters.  A .ibs file
|                  must contain enough [Model Selector] keywords to cover all of
|                  the model selector names specified under the [Pin] and [Series
|                  Pin Mapping] keywords.
|
|                  The section under the [Model Selector] keyword must have two
|                  fields.  The two fields must be separated by at least one
|                  white space.  The first field lists the [Model] name (up to 20
|                  characters long).  The second field contains a short
|                  description of the [Model] shown in the first field.  The
|                  contents and format of this description is not standardized,
|                  however it shall be limited in length so that none of the
|                  descriptions exceed the 80-character length of the line that
|                  it started on. The purpose of the descriptions is to aid the
|                  user of the EDA tool in making intelligent buffer mode
|                  selections and it can be used by the EDA tool in a user
|                  interface dialog box as the basis of an interactive buffer
|                  selection mechanism.
|
|                  The first entry under the [Model Selector] keyword shall be
|                  considered the default by the EDA tool for all those
|                  pins which call this [Model Selector].
|
|                  The operation of this selection mechanism implies that a group
|                  of pins which use the same programmable buffer (i.e., model
|                  selector name) will be switched together from one [Model] to
|                  another.  Therefore, if two groups of pins, for example an
|                  address bus and a data bus, use the same programmable buffer,
|                  and the user must have the capability to configure them
|                  independently, one can use two [Model Selector] keywords with
|                  unique names and the same list of [Model] keywords; however,
|                  the usage of the [Model Selector] is not limited to these
|                  examples.  Many other combinations are possible.

Section 6

```
|
|            M O D E L    S T A T E M E N T
|
|================================================================================
|================================================================================
|      Keyword:   [Model]
|     Required:   Yes
| Description:    Used to define a model, and its attributes.
|  Sub-Params:    Model_type, Polarity, Enable, Vinl, Vinh, C_comp,
|                 C_comp_pullup, C_comp_pulldown, C_comp_power_clamp,
|                 C_comp_gnd_clamp, Vmeas, Cref, Rref, Vref
| Usage Rules:    Each model type must begin with the keyword [Model].  The
|                 model name must match the one that is listed under a [Pin],
|                 [Model Selector] or [Series Pin Mapping] keyword and must
|                 not contain more than 20 characters.  A .ibs file must
|                 contain enough [Model] keywords to cover all of the model
|                 names specified under the [Pin], [Model Selector] and [Series
|                 Pin Mapping] keywords, except for those model names that use
|                 reserved words (POWER, GND and NC).
|
|                 Model_type must be one of the following:
|
|                   Input, Output, I/O, 3-state, Open_drain, I/O_open_drain,
|                   Open_sink, I/O_open_sink, Open_source, I/O_open_source,
|                   Input_ECL, Output_ECL, I/O_ECL, 3-state_ECL, Terminator,
|                   Series, and Series_switch.
|
|                 For true differential models documented under Section 6b,
|                 Model_type must be one of the following:
|
|                 Input_diff, Output_diff, I/O_diff, and 3-state_diff
|
|                 Special usage rules apply to the following.  Some
|                 definitions are included for clarification:
|
|                 Input               These model types must have Vinl and Vinh
|                 I/O                 defined.  If they are not defined, the
|                 I/O_open_drain      parser issues a warning and the default
|                 I/O_open_sink       values of Vinl = 0.8 V and Vinh = 2.0 V
|                 I/O_open_source     are assumed.
|
|                 Input_ECL           These model types must have Vinl and Vinh
|                 I/O_ECL             defined.  If they are not defined, the
|                                     parser issues a warning and the default
|                                     values of Vinl = -1.475 V and Vinh =
|                                     -1.165 V are assumed.
|
|                 Terminator          This model type is an input-only model
|                                     that can have analog loading effects on the
|                                     circuit being simulated but has no digital
|                                     logic thresholds.  Examples of terminators
|                                     are: capacitors, termination diodes, and
|                                     pullup resistors.
|
```

| Output | This model type indicates that an output always sources and/or sinks current and cannot be disabled.

| 3-state | This model type indicates that an output can be disabled, i.e., put into a high impedance state.

| Open_sink | These model types indicate that the output
| Open_drain | has an OPEN side (do not use the [Pullup] keyword, or if it must be used, set I = 0 mA for all voltages specified) and the output SINKS current. Open_drain model type is retained for backward compatibility.

| Open_source | This model type indicates that the output has an OPEN side (do not use the [Pulldown] keyword, or if it must be used, set I = 0 mA for all voltages specified) and the output SOURCES current.

| Input_ECL | These model types specify that the model
| Output_ECL | represents an ECL type logic that follows
| I/O_ECL | different conventions for the [Pulldown]
| 3-state_ECL | keyword.

| Series | This model type is for series models that can be described by [R Series], [L Series], [Rl Series], [C Series], [Lc Series], [Rc Series], [Series Current] and [Series MOSFET] keywords.

| Series_switch | This model type is for series switch models that can be described by [On], [Off], [R Series], [L Series], [Rl Series], [C Series], [Lc Series], [Rc Series], [Series Current] and [Series MOSFET] keywords.

| Input_diff | These model types specify that the model
| Output_diff | defines a true differential model available
| I/O_diff | directly through the [External Model]
| 3-state_diff | keyword documented in Section 6b.

The Model_type subparameter is required.

The C_comp subparameter is required only when C_comp_pullup, C_comp_pulldown, C_comp_power_clamp, and C_comp_gnd_clamp are not present. If the C_comp subparameter is not present, at least one of the C_comp_pullup, C_comp_pulldown, C_comp_power_clamp, or C_comp_gnd_clamp subparameters is required. It is not illegal to include the C_comp subparameter together with one or more of the remaining C_comp_* subparameters, but in that case the simulator will have to make a decision whether to use C_comp or the C_comp_pullup, C_comp_pulldown, C_comp_power_clamp, and C_comp_gnd_clamp subparameters. Under no circumstances should

page 23

the simulator use the value of C_comp simultaneously with the values of the other C_comp_* subparameters.

C_comp_pullup, C_comp_pulldown, C_comp_power_clamp, and C_comp_gnd_clamp are intended to represent the parasitic capacitances of those structures who's I-V characteristics are described by the [Pullup], [Pulldown], [POWER Clamp] and [GND Clamp] I-V tables. For this reason, the simulator should generate a circuit netlist so that, if defined, each of the C_comp_* capacitors are connected in parallel with their corresponding I-V tables, whether or not the I-V table exists. That is, the C_comp_* capacitors are positioned between the signal pad and the nodes defined by the [Pullup Reference], [Pulldown Reference], [POWER Clamp Reference] and [GND Clamp Reference] keywords, or the [Voltage Range] keyword and GND.

The C_comp and C_comp_* subparameters define die capacitance. These values should not include the capacitance of the package. C_comp and C_comp_* are allowed to use "NA" for the min and max values only.

The Polarity, Enable, Vinl, Vinh, Vmeas, Cref, Rref, and Vref subparameters are optional.

Also, optional Rref_diff and Cref_diff subparameters discussed further in Section 6b support the true differential buffer timing test loads. They are used only when the [Diff Pin] keyword connects two models, and each buffer references the same model. The Rref_diff and Cref_diff subparameters can be used with the Rref, Cref, and Vref subparameters for a combined differential and signal-ended timing test load. Single-ended test loads are permitted for differential applications.

The Rref_diff and Cref_diff are recognized only when the [Diff Pin] keyword connects the models. This applies for the true differential buffers in Section 6b and also for differential buffers using identical single-ended models.

The Polarity subparameter can be defined as either Non-Inverting or Inverting, and the Enable subparameter can be defined as either Active-High or Active-Low.

The Cref and Rref subparameters correspond to the test load that the semiconductor vendor uses when specifying the propagation delay and/or output switching time of the model. The Vmeas subparameter is the reference voltage level that the semiconductor vendor uses for the model. Include Cref, Rref, Vref, and Vmeas information to facilitate board-level timing simulation. The assumed connections for Cref, Rref, and Vref are shown in the following diagram:
```
|                       _____
|                      |         |
|                      |    |\   |                   Rref
|                      |Driver| \|------o----/\/\/\----o Vref
|                      |    | /|          |
|                      |    |/ |         === Cref
|                      |_____|          |

|
|
|  Other Notes:   A complete [Model] description normally contains the following
|                 keywords:  [Voltage Range], [Pullup], [Pulldown], [GND Clamp],
|                 [POWER Clamp], and [Ramp].  A Terminator model uses one or
|                 more of the [Rgnd], [Rpower], [Rac], and [Cac] keywords.
|                 However, some models may have only a subset of these keywords.
|                 For example, an input structure normally only needs the
|                 [Voltage Range], [GND Clamp], and possibly the [POWER Clamp]
|                 keywords.  If one or more of [Rgnd], [Rpower], [Rac], and
|                 [Cac] keywords are used, then the Model_type must be
|                 Terminator.

|                Rref_falling, Vref_rising, Vref_falling, Vmeas_rising,
|                Vmeas_falling, Rref_diff, Cref_diff
|  Description:  The [Model Spec] keyword defines four columns under which
|                specification subparameters are defined.
|
|                The following subparameters are defined:
|                Vinh                Input voltage threshold high
|                Vinl                Input voltage threshold low
|                Vinh+               Hysteresis threshold high max Vt+
|                Vinh-               Hysteresis threshold high min Vt+
|                Vinl+               Hysteresis threshold low max Vt-
|                Vinl-               Hysteresis threshold low min Vt-
|                S_overshoot_high    Static overshoot high voltage
|                S_overshoot_low     Static overshoot low voltage
|                D_overshoot_high    Dynamic overshoot high voltage
|                D_overshoot_low     Dynamic overshoot low voltage
|                D_overshoot_time    Dynamic overshoot time
|                Pulse_high          Pulse immunity high voltage
|                Pulse_low           Pulse immunity low voltage
|                Pulse_time          Pulse immunity time
|                Vmeas               Measurement voltage for timing measurements
|                Vref                Timing specification test load voltage
|                Cref                Timing specification capacitive load
|                Rref                Timing specification resistance load
```

```
|                  Cref_rising          Timing specification capacitive load for
|                                       rising edges
|                  Cref_falling         Timing specification capacitive load for
|                                       falling edges
|                  Rref_rising          Timing specification resistance load for
|                                       rising edges
|                  Rref_falling         Timing specification resistance load for
|                                       falling edges
|                  Vref_rising          Timing specification test load voltage for
|                                       rising edges
|                  Vref_falling         Timing specification test load voltage for
|                                       falling edges
|                  Vmeas_rising         Measurement voltage for rising edge timing
|                                       measurements
|                  Vmeas_falling        Measurement voltage for falling edge timing
|                                       measurements
|                  Rref_diff            Timing specification differential
|                                       resistance load
|                  Cref_diff            Timing specification differential
|                                       capacitive load
|
| Usage Rules:  [Model Spec] must follow all other subparameters under the
|               [Model] keyword.
|
|               For each subparameter contained in the first column, the
|               remaining three hold its typical, minimum and maximum values.
|               The entries of typical, minimum and maximum must be placed on
|               a single line and must be separated by at least one white
|               space.  All four columns are required under the [Model Spec]
|               keyword.  However, data is required only in the typical
|               column.  If minimum and/or maximum values are not available,
|               the reserved word "NA" must be used indicating the typical
|               value by default.
|
|               The minimum and maximum values are used for specifications
|               subparameter values that may track the min and max operation
|               conditions of the [Model].  Usually it is related to the
|               Voltage Range settings.
|
|               Unless noted below, no subparameter requires having present
|               any other subparameter.
|
|               Vinh, Vinl rules:
|
|               The threshold subparameter lines provide additional min and
|               max column values, if needed.  The typ column values are still
|               required and would be expected to override the Vinh and Vinl
|               subparameter values specified elsewhere.  Note: the syntax
|               rule that require inserting Vinh and Vinl under models remains
|               unchanged even if the values are defined under the [Model
|               Spec] keyword.
|
|               Vinh+, Vinh-, Vinl+, Vinl- rules:
|
|               The four hysteresis subparmeters (used for Schmitt trigger
|               inputs for defining two thresholds for the rising edges and
|               two thresholds for falling edges) must all be defined before
|               independent input thresholds for rising and falling edges of
```
the hysteresis threshold rules become effective. Otherwise
the standard threshold subparameters remain in effect. The
hysteresis thresholds shall be at the Vinh+ and Vinh- values
for a low-to-high transition, and at the Vinl+ and Vinl-
values for a high-to-low transition.

```

       |oooooo----------------------------------------------oooooooo

                              Time -->
```
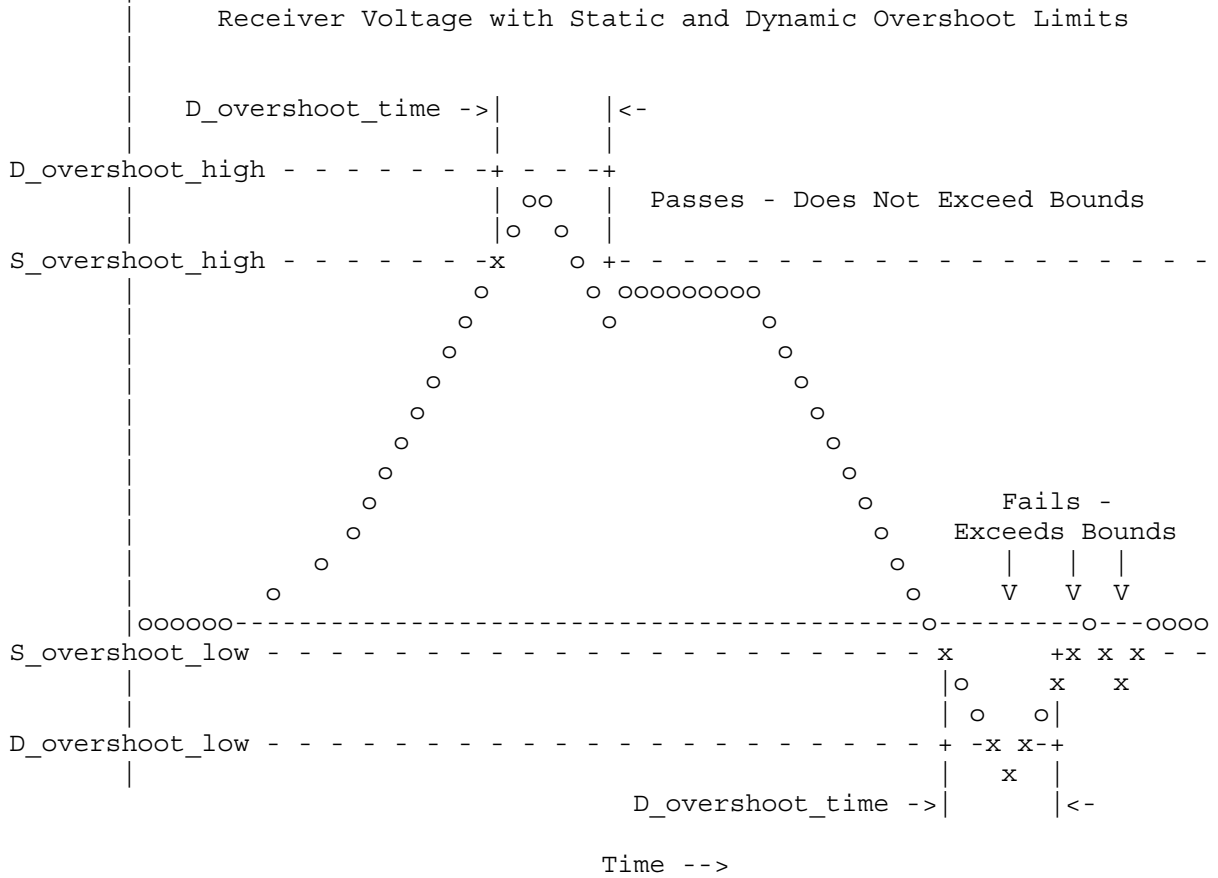

S_overshoot_high, S_overshoot_low rules:

The static overshoot subparameters provide the DC voltage
values for which the model is no longer guaranteed to function
correctly. Typically these are voltages that would cause the
physical component to be destroyed.

D_overshoot_high, D_overshoot_low, D_overshoot_time rules:

The dynamic overshoot values provide a time window during
which the overshoot may exceed the static overshoot limits
but be below the dynamic overshoot limits. D_overshoot_time
is required for dynamic overshoot testing. In addition, if
D_overshoot_high is specified, then S_overshoot_high is
necessary for testing beyond the static limit. Similarly, if
D_overshoot_low is specified, then S_overshoot_low is
necessary for testing beyond the static limit.

|
|                            Time -->
|
|        Pulse_high, Pulse_low, Pulse_time rules:
|
|        The pulse immunity values provide a time window during which
|        a rising pulse may exceed the nearest threshold value but
|        be below the pulse voltage value and still not cause the
|        input to switch.  Pulse_time is required for pulse immunity
|        testing.  A rising response is tested only if Pulse_high is
|        specified.  Similarly, a falling response is tested only if
|        Pulse_low is specified.  The rising response may exceed the
|        Vinl value, but remain below the Pulse_high value.
|
|        Similarly, the falling response may drop below the Vinh value,
|        but remain above the Pulse_low value.  In either case the
|        input is regarded as immune to switching if the responses
|        are within these extended windows.  If the hysteresis
|        thresholds are defined, then the rising response shall use
|        Vinh- as the reference voltage, and the falling response shall
|        use Vinl+ as the reference voltage.

|          |               o                                           o
|          |             o                                           o
|          |ooooooo-----------------------------------------------------------o
|
|                                   Time -->
|
|               Vmeas, Vref, Cref, Rref rules:
|
|               The Vmeas, Vref, Cref and Rref values under the [Model Spec]
|               keyword override their respective values entered elsewhere.
|               Note that a Vmeas, Vref, Cref or Rref subparameters may not be
|               used if its edge specific version (*_rising or *_falling) is
|               used.
|
|               Cref_rising, Cref_falling, Rref_rising, Rref_falling,
|               Vref_rising, Vref_falling, Vmeas_rising, Vmeas_falling rules:
|
|               Use these subparameters when specifying separate timing test
|               loads and voltages for rising and falling edges.  If one
|               'rising' or 'falling' subparameter is used, then the
|               corresponding 'rising' or 'falling' subparameter must be
|               present.  The values listed in these subparameters override
|               any corresponding Cref, Vref, Rref or Vmeas values entered
|               elsewhere.
|
|               Rref_diff, Cref_diff rules:
|
|               The Rref_diff and Creff_diff values under the [Model Spec]
|               keyword override their respective values entered elsewhere.
|               These subparameters are used only when the model is referenced
|               by the [Diff Pin] keyword.  These follow the same rules as
|               the corresponding subparameters documented under the [Model]
|               keyword.  See Section 6b for more discussion on true and
|               single-ended differential operation.

|===============================================================================
|      Keyword:   [Receiver Thresholds]
|     Required:   No
|   Sub-Params:   Vth, Vth_min, Vth_max, Vinh_ac, Vinh_dc, Vinl_ac, Vinl_dc,
|                 Threshold_sensitivity, Reference_supply, Vcross_low,
|                 Vcross_high, Vdiff_ac, Vdiff_dc, Tslew_ac, Tdiffslew_ac
|  Description:    The [Receiver Thresholds] keyword defines both a set of
|                 receiver input thresholds as well as their sensitivity to
|                 variations in a referenced supply.  The subparameters are
|                 defined as follows:
|
|                 Vth, Vth_min and Vth_max are the ideal input threshold
|                 voltages at which the output of a digital logic receiver
|                 changes state.  Vth is the nominal input threshold voltage
|                 under the voltage, temperature and process conditions that
|                 define 'typ'.  Vth_min is the minimum input threshold
|                 voltage at 'typ' conditions while Vth_max is the maximum
|                 input threshold voltage at 'typ' conditions.
|
|                 Vinh_ac is the voltage that a low-to-high going input
|                 waveform must reach in order to guarantee that the
|                 receiver's output has changed state.  In other words,
|                 reaching Vinh_ac is sufficient to guarantee a receiver
|                 state change. Vinh_ac is expressed as an offset from Vth.
|
|                 Vinh_dc is the voltage that an input waveform must remain
|                 above (more positive than) in order to guarantee that a
|                 receiver output will NOT change state.  Vinh_dc is
|                 expressed as an offset from Vth.
|
|                 Vinl_ac is the voltage that a high-to-low going input
|                 waveform must reach in order to guarantee that the
|                 receiver's output has changed state.  In other words,
|                 reaching Vinl_ac is sufficient to guarantee a receiver
|                 state change.  Vinl_ac is expressed as an offset from Vth.
|
|                 Vinl_dc is the voltage that an input waveform must remain
|                 below (more negative than) in order to guarantee that a
|                 receiver's output will NOT change state.  Vinl_dc is
|                 expressed as an offset from Vth.
|
|                 Threshold_sensitivity is a unit less number that specifies
|                 how Vth varies with respect to the supply voltage defined
|                 by the Reference_supply subparameter. Threshold_sensitivity
|                 is defined as:
|
|                                     change in input threshold voltage
|                 Threshold_sensitivity = ---------------------------------
|                                     change in referenced supply voltage
|
|                 Threshold_sensitivity must be entered as a whole number or
|                 decimal, not as a fraction.
|
|                 Reference_supply indicates which supply voltage Vth tracks;
|                 i.e., it indicates which supply voltage change causes a
|                 change in input threshold.  The legal arguments to this
|                 subparameter are as follows:
|                 Power_clamp_ref  The supply voltage defined by the

                                page 32
```

```
|                            [POWER Clamp Reference] keyword
|              Gnd_clamp_ref     The supply voltage defined by the
|                                [GND Clamp Reference] keyword
|              Pullup_ref        The supply voltage defined by the
|                                [Pullup reference] keyword
|              Pulldown_ref      The supply voltage defined by the
|                                [Pulldown reference] keyword
|              Ext_ref           The supply voltage defined by the
|                                [External Reference] keyword
|
|              Tslew_ac and Tdiffslew_ac measures the absolute difference
|              in time between the point at which an input waveform
|              crosses Vinl_ac and the point it crosses Vinh_ac.  The
|              purpose of this parameter is to document the maximum amount
|              of time an input signal may take to transition between
|              Vinh_ac and Vinl_ac and still allow the device to meet its
|              input setup and hold specifications.  Tslew_ac is the
|              parameter used for single ended receivers while
|              Tdiffslew_ac must be used for receivers with differential
|              inputs.
|
|              Vcross_low is the least positive voltage at which a
|              differential receivers' input signals may cross while
|              switching and still allow the receiver to meet its timing
|              and functional specifications.  Vcross_low is specified
|              with respect to 0 V.
|
|              Vcross_high is the most positive voltage at which a
|              differential receivers' input signals may cross while
|              switching and still allow the receiver to meet its timing
|              and functional specifications.  Vcross_high is specified
|              with respect to 0 V.
|
|              Vdiff_dc is the minimum voltage difference between the
|              inputs of a differential receiver that guarantees the
|              receiver will not change state.
|
|              Vdiff_ac is the minimum voltage difference between the
|              inputs of a differential receiver that guarantees the
|              receiver will change state.
|
| Usage Rules:  The [Receiver Thresholds] keyword is valid if the model type
|              includes any reference to input or I/O.  For single ended
|              receivers the Vinh_ac, Vinh_dc, Vinl_ac, Vinh_dc, Vth and
|              Tslew_ac subparameters are required and override the Vinh,
|              Vinl, Vinh+/- and Vinl+/- subparameters declared under the
|              [Model] or [Model Spec] keywords.  For single ended receivers
|              the Vth_min, Vth_max, Threshold_sensitivity and
|              Reference_supply subparameters are optional.  However, if
|              the Threshold_sensitivity subparameter is present then the
|              Reference_supply subparameter must also be present.
|
|              For differential receivers (i.e., the [Receiver Thresholds]
|              keyword is part of a [Model] statement that describes a pin
|              listed in the [Diff Pin] keyword) then the Vcross_low,
|              Vcross_high, Vdiff_ac, Vdiff_dc and Tdiffslew_ac subparameters
|              are required. The rest of the subparameters are not
|              applicable.  The Vdiff_ac and Vdiff_dc values override the
```

```
|                         value of the vdiff subparameter specified by the [Diff Pin]
|                         keyword.  Note that Vcross_low and Vcross_high are valid over
|                         the device's minimum and maximum operating  conditions.
|
|                         Subparameter Usage Rules:
|                         Numerical arguments are separated from their associated
|                         subparameter by an equals sign (=); white space around the
|                         equals sign is optional.  The argument to the Reference_supply
|                         subparameter is separated from the subparameter by white
|                         space.
|
|                         Vth at Minimum or Maximum Operating Conditions:
|                         As described above, the Vth_min and Vth_max subparameters
|                         define the minimum and maximum input threshold values under
|                         typical operating conditions.  There is no provision for
|                         directly specifying Vth under minimum or maximum operating
|                         conditions.  Instead, these values are calculated using the
|                         following equation:
|
|                         Vth(min/max) = Vth* + [(Threshold_sensitivity) X
|                                                         (change in supply voltage)]
|
|                         where Vth* is either Vth, Vth_min or Vth_max as appropriate,
|                         and the supply voltage is the one indicated by the
|                         Reference_Supply subparameter.

|
|===============================================================================
|      Keyword:   [Add Submodel]
|     Required:   No
|  Description:   References a submodel to be added to an existing model.
|  Usage Rules:   The [Add Submodel] keyword is invoked within a model to add
|                 the functionality that is contained in the submodel or list of
|                 submodels in each line that follows.  The first column
|                 contains the submodel name.  The second column contains a
|                 submodel mode under which the submodel is used.
|
|                 If the top-level model type is one of the I/O or 3-state
|                 models, the submodel mode may be Driving, Non-Driving, or All.
|                 For example, if the submodel mode is Non-Driving, then the
|                 submodel is used only in the high-Z state of a 3-state model.
|                 Set the submodel mode to All if the submodel is to be used for
|                 all modes of operation.
|
|                 The submodel mode cannot conflict with the top-level model
|                 type.  For example, if the top-level model type is an Open or
|                 Output type, the submodel mode cannot be set to Non-Driving.
|                 Similarly, if the top-level model type is Input, the submodel
|                 mode cannot be set to Driving.
|
|                 The [Add Submodel] keyword is not defined for Series or
|                 Series_switch model types.
|
|                 Refer to the ADD SUBMODEL DESCRIPTION section in this document
|                 for the descriptions of available submodels.
|-------------------------------------------------------------------------------
[Add Submodel]
| Submodel_name        Mode
Bus_Hold_1             Non-Driving | Adds the electrical characteristics of
                                   | [Submodel] Bus_Hold_1 for receiver or
                                   | high-Z mode only.
Dynamic_clamp_1        All         | Adds the Dynmanic_clamp_1 model for
                                   | all modes of operation.
|
|===============================================================================
|      Keyword:   [Driver Schedule]
|     Required:   No
|  Description:   Describes the relative model switching sequence for referenced
|                 models to produce a multi-staged driver.
|  Usage Rules:   The [Driver schedule] keyword establishes a hierarchical order
```

between models and should be placed under the [Model] which
acts as the top-level model. The scheduled models are then
referenced from the top-level model by the [Driver Schedule]
keyword.

When a multi-staged buffer is modeled using the [Driver
Schedule] keyword, all of its stages (including the first
stage, or normal driver) have to be modeled as scheduled
models.

If there is support for this feature in a EDA tool, the
[Driver Schedule] keyword will cause it to use the
[Pulldown], [Pulldown Reference], [Pullup], [Pullup
Reference], [Voltage Range], [Ramp], [Rising Waveform] and
[Falling Waveform] keywords from the scheduled models
instead of the top-level model, according to the timing
relationships described in the [Driver Schedule] keyword.
Consequently, the keywords in the above list will be ignored
in the top-level model. Also, all other keywords not shown
in the above list will be ignored in the scheduled model(s).

However, both the top-level and the scheduled model(s) have
to be complete models, i.e., all of the required keywords
must be present and follow the syntactical rules.

For backwards compatibility reasons and for EDA tools which
do not support multi-staged switching, the keywords in the
above list can be used in the top-level [Model] to describe
the overall characteristics of the buffer as if it was a
composite model. It is not guaranteed, however, that such a
top-level model will yield the same simulation results as a
full multi-stage model. It is recommended that a "golden
waveform" for the device consisting of a [Rising Waveform]
table and a [Falling Waveform] table be supplied in the
top-level model to serve as a reference for validation.

Even though some of the keywords are ignored in the scheduled
model, it may still make sense in some cases to supply
correct data with them. One such situation would arise when a
[Model] is used both as a regular top-level model as well as a
scheduled model.

The [Driver Schedule] table consists of five columns. The
first column contains the model names of other models that
exists in the .ibs file. The remaining four columns describe
delays: Rise_on_dly, Rise_off_dly, Fall_on_dly, and
Fall_off_dly. The t=0 time of each delay is the event when
the EDA tool's internal pulse initiates a rising or falling
transition. All specified delay values must be equal to or
greater than 0. There are only five valid combinations in
which these delay values can be defined:

     1) Rise_on_dly   with   Fall_on_dly
     2) Rise_off_dly   with   Fall_off_dly
     3) Rise_on_dly   with   Rise_off_dly
     4) Fall_on_dly   with   Fall_off_dly
     5) All four delays defined
         (be careful about correct sequencing)

The four delay parameters have the meaning as described
below. (Note that this description applies to buffer types
which have both pullup and pulldown structures. For those
buffer types which have only a pullup or pulldown structure,
the description for the missing structure can be omitted.)

Rise_on_dly is the amount of time that elapses from the
internal simulator pulse initiating a RISING edge to the
t = 0 time of the waveform or ramp that turns the I-V table of
the PULLUP device ON, and the t = 0 time of the waveform or
ramp that turns the I-V table of the PULLDOWN device OFF (if
they were not already turned ON and OFF, respectively, by
another event).

Rise_off_dly is the amount of time that elapses from the
internal simulator pulse initiating a RISING edge to the
t = 0 time of the waveform or ramp that turns the I-V table of
the PULLUP device OFF, and the t = 0 time of the waveform or
ramp that turns the I-V table of the PULLDOWN device ON (if
they were not already turned ON and OFF, respectively, by
another event).

Fall_on_dly is the amount of time that elapses from the
internal simulator pulse initiating a FALLING edge to the
t = 0 time of the waveform or ramp that turns the I-V table of
the PULLDOWN device ON, and the t = 0 time of the waveform or
ramp that turns the I-V table of the PULLUP device OFF (if
they were not already turned ON and OFF, respectively, by
another event).

Fall_off_dly is the amount of time that elapses from the
internal simulator pulse initiating a FALLING edge to the
t = 0 time of the waveform or ramp that turns the I-V table of
the PULLDOWN device OFF, and the t = 0 time of the waveform or
ramp that turns the I-V table of the PULLUP device ON (if
they were not already turned ON and OFF, respectively, by
another event).

Note that some timing combinations may only be possible if
the two halves of a complementary buffer are modeled
separately as two open_* models.

Use 'NA' when no delay value is applicable. For each
scheduled model the transition sequence must be complete,
i.e., the scheduled model must return to its initial state.

No [Driver Schedule] table may reference a model which itself
has within it a [Driver Schedule] keyword.

Other Notes: The added models typically consist of Open_sink (Open_drain)
or Open_source models to provide sequentially increased drive
strengths. The added drive may be removed within the same
transition for a momentary boost or during the opposite
transition.

The syntax also allows for reducing the drive strength.

```
|              Note that the Rise_on_dly, Rise_off_dly, Fall_on_dly,
|              Fall_off_dly parameters are single value parameters, so
|              typical, minimum and maximum conditions cannot be described
|              with them directly.  In order to account for those effects,
|              one can refer to the fastest waveform table with the delay
|              number and then insert an appropriate amount of horizontal
|              lead in section in those waveforms which need more delay.
|
|              Notice that the C_comp parameter of a multi-stage buffer is
|              defined in the top-level model.  The value of C_comp
|              therefore includes the total capacitance of the entire
|              buffer, including all of its stages.  Since the rising and
|              falling waveform measurements include the effects of
|              C_comp, each of these waveforms must be generated with the
|              total C_comp present, even if the various stages of the
|              buffer are characterized individually.
|
|              Note: In a future release, the [Driver Schedule] keyword may
|              be replaced by a newer method of specification that is
|              consistent with some other planned extensions.  However, the
|              [Driver Schedule] syntax will continue to be supported.
|------------------------------------------------------------------------------
[Driver Schedule]
| Model_name     Rise_on_dly  Rise_off_dly  Fall_on_dly  Fall_off_dly
  MODEL_OUT      0.0ns        NA            0.0ns        NA
|
|                                 Examples of added multi-staged transitions
  M_O_SOURCE1    0.5ns        NA            0.5ns        NA

|              low to high (high-Z)      high (high-Z) to low
  M_O_DRAIN2     NA           NA            1.5n         2.0n
|                 high (high-Z)           high to low to high
|
|==============================================================================
|     Keyword:   [Temperature Range]
|    Required:   Yes, if other than the preferred 0, 50, 100 degree Celsius
|                range
| Description:   Defines the temperature range over which the model is to
|                operate.
| Usage Rules:   List the actual die temperatures (not percentages) in the typ,
|                min, max format.  "NA" is allowed for min and max only.
| Other Notes:   The [Temperature Range] keyword also describes the temperature
|                range over which the various I-V tables and ramp rates were
|                derived.  Refer to NOTES ON DATA DERIVATION METHODS for rules
|                on which temperature values to put in the 'min' and 'max'
|                columns.
|------------------------------------------------------------------------------
| variable              typ            min             max
[Temperature Range]     27.0           -50             130.0
|
|==============================================================================
|     Keyword:   [Voltage Range]
|    Required:   Yes, if [Pullup Reference], [Pulldown Reference], [POWER
|                Clamp Reference], and [GND Clamp Reference] are not present
| Description:   Defines the power supply voltage tolerance over which the
```

```
|                     model is intended to operate.  It also specifies the default
|                     voltage rail to which the [Pullup] and [POWER Clamp] I-V data
|                     is referenced.
| Usage Rules:   Provide actual voltages (not percentages) in the typ, min, max
|                     format.  "NA" is allowed for the min and max values only.
| Other Notes:   If the [Voltage Range] keyword is not present, then all four
|                     of the keywords described below must be present: [Pullup
|                     Reference], [Pulldown Reference], [POWER Clamp Reference],
|                     and [GND Clamp Reference].  If the [Voltage Range] is present,
|                     the other keywords are optional and may or may not be used as
|                     required.  It is legal (although redundant) for an optional
|                     keyword to specify the same voltage as specified by the
|                     [Voltage Range] keyword.
|-------------------------------------------------------------------------------
| variable               typ               min               max
[Voltage Range]          5.0V              4.5V              5.5V
|
|===============================================================================
|     Keyword:   [Pullup Reference]
|     Required:   Yes, if the [Voltage Range] keyword is not present
| Description:   Defines a voltage rail other than that defined by the [Voltage
|                     Range] keyword as the reference voltage for the [Pullup] I-V
|                     data.
| Usage Rules:   Provide actual voltages (not percentages) in the typ, min, max
|                     format.  "NA" is allowed for the min and max values only.
| Other Notes:   This keyword, if present, also defines the voltage range over
|                     which the typ, min, and max dV/dt_r values are derived.
|-------------------------------------------------------------------------------
| variable               typ               min               max
[Pullup Reference]       5.0V              4.5V              5.5V
|
|===============================================================================
|     Keyword:   [Pulldown Reference]
|     Required:   Yes, if the [Voltage Range] keyword is not present
| Description:   Defines a power supply rail other than 0 V as the reference
|                     voltage for the [Pulldown] I-V data.  If this keyword is not
|                     present, the voltage data points in the [Pulldown] I-V table
|                     are referenced to 0 V.
| Usage Rules:   Provide actual voltages (not percentages) in the typ, min, max
|                     format.  "NA" is allowed for the min and max values only.
| Other Notes:   This keyword, if present, also defines the voltage range over
|                     which the typ, min, and max dV/dt_f values are derived.
|-------------------------------------------------------------------------------
| variable               typ               min               max
[Pulldown Reference]     0V                0V                0V
|
|===============================================================================
|     Keyword:   [POWER Clamp Reference]
|     Required:   Yes, if the [Voltage Range] keyword is not present
| Description:   Defines a voltage rail other than that defined by the [Voltage
|                     Range] keyword as the reference voltage for the [POWER Clamp]
|                     I-V data.
| Usage Rules:   Provide actual voltages (not percentages) in the typ, min,
|                     max format.  "NA" is allowed for the min and max values only.
| Other Notes:   Refer to the "Other Notes" section of the [GND Clamp
|                     Reference] keyword.
|-------------------------------------------------------------------------------
```

```
| variable               typ             min             max
[POWER Clamp Reference] 5.0V            4.5V            5.5V
|
|=============================================================================
|     Keyword:    [GND Clamp Reference]
|    Required:    Yes, if the [Voltage Range] keyword is not present
| Description:    Defines a power supply rail other than 0 V as the reference
|                 voltage for the [GND Clamp] I-V data.  If this keyword is not
|                 present, the voltage data points in the [GND Clamp] I-V table
|                 are referenced to 0 V.
| Usage Rules:    Provide actual voltages (not percentages) in the typ, min, max
|                 format.  "NA" is allowed for the min and max values only.
| Other Notes:    Power Supplies: It is intended that standard TTL and CMOS
|                 models be specified using only the [Voltage Range] keyword.
|                 However, in cases where the output characteristics of a model
|                 depend on more than a single supply and ground, or a [Pullup],
|                 [Pulldown], [POWER Clamp], or [GND Clamp] table is referenced
|                 to something other than the default supplies, use the
|                 additional 'reference' keywords.
|-----------------------------------------------------------------------------
| variable               typ             min             max
[GND Clamp Reference]   0V              0V              0V
|
|=============================================================================
|     Keyword:    [External Reference]
|    Required:    Yes, if a receiver's input threshold is determined by an
|                 external reference voltage
| Description:    Defines a voltage source that supplies the reference voltage
|                 used by a receiver for its input threshold reference.
| Usage Notes:    Provide actual voltages (not percentages in the typ, min max
|                 format.  "NA" is allowed for the min and max values only.
|                 Note that the numerically largest value should be placed in
|                 'max' column, while the numerically smallest value should
|                 be placed in the 'min' column.
|-----------------------------------------------------------------------------
| variable               typ             min             max
[External Reference]    1.00V           0.95V           1.05V
|
|=============================================================================
|     Keywords:   [TTgnd], [TTpower]
|    Required:    No
| Description:    These keywords specify the transit time parameters used to
|                 estimate the transit time capacitances or develop transit time
|                 capacitance tables for the [GND Clamp] and [POWER Clamp]
|                 tables.
| Usage Rules:    For each of these keywords, the three columns hold the transit
|                 values corresponding to the typical, minimum and maximum [GND
|                 Clamp] or [POWER Clamp] tables, respectively.  The entries for
|                 TT(typ), TT(min), and TT(max) must be placed on a single line
|                 and must be separated by at least one white space.  All three
|                 columns are required under these keywords.  However, data is
|                 required only in the typical column.  If minimum and/or
|                 maximum values are not available, the reserved word "NA" must
|                 be used indicating the TT(typ) value by default.
| Other Notes:    The transit time capacitance is added to C_comp.  It is in a
|                 SPICE reference model as Ct = TT * d(Id)/d(Vd) where
|                 d(Id)/d(Vd) defines the DC conductance at the incremental DC
|                 operating point of the diode, and TT is the transit time.
```

| This expression does not include any internal series
| resistance. Such a resistance is assumed to be negligible in
| practice. Assume that the internal diode current (Id) -
| voltage (Vd) relationship is Id = Is * (exp(q(Vd)/kT) - 1)
| where Is is the saturation current, q is electron charge, k is
| Boltzmann's constant, and T is temperature in degrees Kelvin.
| Then d(Id)/d(Vd) is approximately (q/kT) * Id when the diode
| is conducting, and zero otherwise. This yields the
| simplification Ct = TT * (q/kT) * Id. The Id is found from
| the [GND Clamp] and [POWER Clamp] operating points, and the
| corresponding TTgnd or TTpower is used to calculate the Ct
| value. If the [Temperature Range] keyword is not defined,
| then use the default "typ" temperature for all Ct
| calculations.
|
| The effective TT parameter values are intended to APPROXIMATE
| the effects. They may be different from the values found in
| the SPICE diode equations. Refer to the NOTES ON DATA
| DERIVATION METHOD for extracting the effective values.
|---

| variable   TT(typ)   TT(min)   TT(max)
[TTgnd]   10n   12n   9n
[TTpower]   12n   NA   NA
|
|===
| **Keywords: [Pulldown], [Pullup], [GND Clamp], [POWER Clamp]**
| Required: Yes, if they exist in the model
| Description: The data points under these keywords define the I-V tables of
| the pulldown and pullup structures of an output buffer and the
| I-V tables of the clamping diodes connected to the GND and the
| POWER pins, respectively. Currents are considered positive
| when their direction is into the component.
| Usage Rules: In each of these sections, the first column contains the
| voltage value, and the three remaining columns hold the
| typical, minimum, and maximum current values. The four
| entries, Voltage, I(typ), I(min), and I(max) must be placed on
| a single line and must be separated by at least one white
| space.
|
| All four columns are required under these keywords. However,
| data is only required in the typical column. If minimum
| and/or maximum current values are not available, the reserved
| word "NA" must be used. "NA" can be used for currents in the
| typical column, but numeric values MUST be specified for the
| first and last voltage points on any I-V table. Each I-V
| table must have at least 2, but not more than 100, rows.
|
| Other Notes: The I-V table of the [Pullup] and the [POWER Clamp] structures
| are 'Vcc relative', meaning that the voltage values are
| referenced to the Vcc pin. (Note: Under these keywords, all
| references to 'Vcc' refer to the voltage rail defined by the
| [Voltage Range], [Pullup Reference], or [POWER Clamp
| Reference] keywords, as appropriate.) The voltages in the
| data tables are derived from the equation: Vtable = Vcc -
| Voutput.
|
| Therefore, for a 5 V model, -5 V in the table actually
| means 5 V above Vcc, which is +10 V with respect to ground;

and 10 V means 10 V below Vcc, which is -5 V with respect to
ground. Vcc-relative data is necessary to model a pullup
structure properly, since the output current of a pullup
structure depends on the voltage between the output and Vcc
pins and not the voltage between the output and ground pins.
Note that the [GND Clamp] I-V table can include quiescent
input currents, or the currents of a 3-stated output, if so
desired.

When tabulating data for ECL models, the data in the
[Pulldown] table is measured with the output in the 'logic
low' state. In other words, the data in the table represents
the I-V characteristics of the output when the output is at
the most negative of its two logic levels. Likewise, the data
in the [Pullup] table is measured with the output in the
'logic one' state and represents the I-V characteristics when
the output is at the most positive logic level. Note that in
BOTH of these cases, the data is referenced to the Vcc supply
voltage, using the equation: Vtable = Vcc - Voutput.

Monotonicity Requirements:

To be monotonic, the I-V table data must meet any one of the
following 8 criteria:
   1- The CURRENT axis either increases or remains constant as
      the voltage axis is increased.
   2- The CURRENT axis either increases or remains constant as
      the voltage axis is decreased.
   3- The CURRENT axis either decreases or remains constant as
      the voltage axis is increased.
   4- The CURRENT axis either decreases or remains constant as
      the voltage axis is decreased.

   5- The VOLTAGE axis either increases or remains constant as
      the current axis is increased.
   6- The VOLTAGE axis either increases or remains constant as
      the current axis is decreased.
   7- The VOLTAGE axis either decreases or remains constant as
      the current axis is increased.
   8- The VOLTAGE axis either decreases or remains constant as
      the current axis is decreased.

An IBIS syntax checking program shall test for non-monotonic
data and provide a maximum of one warning per I-V table if
non-monotonic data is found. For example:

    "Warning: Line 300, Pulldown I-V table for model DC040403
     is non-monotonic! Most simulators will filter this data
     to remove the non-monotonic data."

It is also recognized that the data may be monotonic if
currents from both the output stage and the clamp diode are
added together as most simulators do. To limit the complexity
of the IBIS syntax checking programs, such programs will
conduct monotonicity testing only on one I-V table at a time.

It is assumed that the simulator sums the clamp tables
together with the appropriate [Pullup] or [Pulldown] table

| when a buffer is driving high or low, respectively. From this
| assumption and the nature of 3-statable buffers, it follows
| that the data in the clamping table sections are handled as
| constantly present tables and the [Pullup] and [Pulldown]
| tables are used only when needed in the simulation.
|
| The clamp tables of an Input or I/O buffer can be measured
| directly with a curve tracer, with the I/O buffer 3-stated.
| However, sweeping enabled buffers results in tables that are
| the sum of the clamping tables and the output structures.
| Based on the assumption outlined above, the [Pullup] and
| [Pulldown] tables of an IBIS model must represent the
| difference of the 3-stated and the enabled buffer's tables.
| (Note that the resulting difference table can demonstrate a
| non-monotonic shape.) This requirement enables the simulator
| to sum the tables, without the danger of double counting, and
| arrive at an accurate model in both the 3-stated and enabled
| conditions.
|
| Since in the case of a non 3-statable buffer, this difference
| table cannot be generated through lab measurements (because
| the clamping tables cannot be measured alone), the [Pullup]
| and [Pulldown] tables of an IBIS model can contain the sum of
| the clamping characteristics and the output structure. In
| this case, the clamping tables must contain all zeroes, or the
| keywords must be omitted.

|
|===============================================================================
|    Keywords:  [Rgnd], [Rpower], [Rac], [Cac]
|    Required:  Yes, if they exist in the model
| Description:  The data for these keywords define the resistance values of
|               Rgnd and Rpower connected to GND and the POWER pins,
|               respectively, and the resistance and capacitance values for an
|               AC terminator.
| Usage Rules:  For each of these keywords, the three columns hold the
|               typical, minimum, and maximum resistance values.  The three
|               entries for R(typ), R(min), and R(max), or the three entries
|               for C(typ), C(min), and C(max) must be placed on a single line
|               and must be separated by at least one white space.  All three
|               columns are required under these keywords.  However, data is
|               only required in the typical column.  If minimum and/or
|               maximum values are not available, the reserved word "NA" must
|               be used indicating the R(typ) or C(typ) value by default.
| Other Notes:  It should be noted that [Rpower] is connected to 'Vcc' and
|               [Rgnd] is connected to 'GND'.  However, [GND Clamp Reference]
|               voltages, if defined, apply to [Rgnd].  [POWER Clamp
|               Reference] voltages, if defined, apply to [Rpower].  Either or
|               both [Rgnd] and [Rpower] may be defined and may coexist with
|               [GND Clamp] and [POWER Clamp] tables.  If the terminator
|               consists of a series R and C (often referred to as either an
|               AC or RC terminator), then both [Rac] and [Cac] are required.
|               When [Rgnd], [Rpower], or [Rac] and [Cac] are specified, the
|               Model_type must be Terminator.
|

|    Keywords:  [On], [Off]
|    Required:  Yes, both [On] and [Off] for Series_switch Model_types only
| Description:  The 'On' state electrical models are positioned under [On].
|               The 'Off' state electrical models are positioned under [Off].
| Usage Rules:  These keywords are only valid for Series_switch Model_types.
|               Only keywords associated with Series_switch electrical models
|               are permitted under [On] or [Off].  The Series electrical
|               models describe the path for one state only and do not use
|               the [On] and [Off] keywords.
```

|
| In Series_switch models, [On] or [Off] must be positioned
| before any of the [R Series], [L Series], Rl Series],
| [C Series], [Lc Series], [Rc Series], [Series Current],
| and [Series MOSFET] keywords. There is no provision for
| any of these keywords to be defined once, but to apply to
| both states.
|---
[On]
| ... On state keywords such as [R Series], [Series Current], [Series MOSFET]
[Off]
| ... Off state keywords such as [R Series], [Series Current]
|
|===
| **Keywords: [R Series], [L Series], [Rl Series], [C Series], [Lc Series],
| [Rc Series]**
| Required: Yes, if they exist in the model
| Description: The data for these keywords allow the definition of Series or
| Series_switch R, L or C paths.
| Usage Rules: For each of these keywords, the three columns hold the
| typical, minimum, and maximum resistance values. The three
| entries must be placed on a single line and must be separated
| by at least one white space. All three columns are required
| under these keywords. However, data is only required in the
| typical column. If minimum and/or maximum values are not
| available, the reserved word "NA" must be used.
| Other Notes: This series RLC model is defined to allow IBIS to model simple
| passive models and/or parasitics.
|
| These keywords are valid only for Series or Series_switch
| Model_types.
|
| The model is:
|
| R Series

|
|===========================================================================
|     Keyword:   [Series Current]
|    Required:   Yes, if they exist in the model
| Description:   The data points under this keyword define the I-V tables for
|                voltages measured at Pin 1 with respect to Pin 2.  Currents
|                are considered positive if they flow into Pin 1.  Pins 1 and
|                2 are listed under the [Series Pin Mapping] keyword under
|                columns [Series Pin Mapping] and pin_2, respectively.
| Usage Rules:   The first column contains the voltage value, and the remaining
|                columns hold the typical, minimum, and maximum current values.
|                The four entries, Voltage, I(typ), I(min), and I(max) must be
|                placed on a single line and must be separated by at least one
|                white space.
|
|                All four columns are required under these keywords.  However,
|                data is only required in the typical column.  If minimum
|                and/or maximum current values are not available, the reserved
|                word "NA" must be used.  "NA" can be used for currents in the
|                typical column, but numeric values MUST be specified for the
|                first and last voltage points on any I-V table.  Each I-V
|                table must have at least 2, but not more than 100 rows.
|
| Other Notes:   There is no monotonicity requirement. However the model
|                supplier should realize that it may not be possible to derive
|                a behavioral model from non-monotonic data.
|
|                This keyword is valid only for Series or Series_switch
|                Model_types.
|
|                The model is:
|
|                            Table Current
|                               ------>
|                         +  Table Voltage  -
|                   Pin 1  |---------|  Pin 2
|                     <---+           +--->
|                         |---------|
|
|                C_comp values are ignored for [Series Current] models.

|
|=============================================================================
|      Keyword:  [Series MOSFET]
|     Required:  Yes, for series MOSFET switches
| Description:   The data points under this keyword define the I-V tables for
|                voltages measured at Pin 2 for a given Vds setting.  Currents
|                are considered positive if they flow into Pin 1.  Pins 1 and
|                2 are listed under the [Series Pin Mapping] keyword under
|                [Series Pin Mapping] and pin_2 columns, respectively.
|  Sub-Params:   Vds
| Usage Rules:   The first column contains the voltage value, and the three
|                remaining columns hold the typical, minimum, and maximum
|                current values.  The four entries, Voltage, I(typ), I(min),
|                and I(max) must be placed on a single line and must be
|                separated by at least one white space.
|
|                All four columns are required under these keywords.  However,
|                data is only required in the typical column.  If minimum
|                and/or maximum current values are not available, the reserved
|                word "NA" must be used.  "NA" can be used for currents in the
|                typical column, but numeric values MUST be specified for the
|                first and last voltage points on any I-V table.  Each I-V
|                table must have at least 2, but not more than 100 rows.
|
| Other Notes:   There is no monotonicity requirement. However the model
|                supplier should realize that it may not be possible to derive
|                a behavioral model from non-monotonic data.
|
|
|                                Table Current
|                                 -------->  Ids
|                            +      Vds       -
|
|                                  Vcc
|                                   | g
|                                 __|__
|                                 -----   NMOS
|                        Pin 1 |       |    Pin 2
|                          <---+       +--->  +  Voltage = Vcc - Vs
|                          d   |_____|    s
|                        PMOS  --+--          Vs
|                                | g
|                               GND       -
|
|                Either of the FET's could be removed (or have zero current
|                contribution.  Thus this model covers all four conditions,
|                off, single NMOS, single PMOS and parallel NMOS/PMOS.
|
|                      Voltage = Table Voltage = Vtable = Vcc - Vs
|                      Ids = Table Current for a given Vcc and Vds
```

Internal Logic that is generally referenced to the power rail
is used to set the NMOS MOSFET switch to its 'ON' state.
Internal logic likewise referenced to ground is used to set
the PMOS device to its 'ON' state if the PMOS device is
present. Thus the [Voltage Range] settings provide the
assumed gate voltages. If the [POWER Clamp Reference] exists,
it overrides the [Voltage Range] value. The table entries are
actually Vgs values of the NMOS device and Vcc - Vgs values of
the PMOS device, if present. The polarity conventions are
identical with those used for other tables that are
referenced to power rails. Thus the voltage column can be
viewed as a table defining the source voltages Vs according to
the convention: Vtable = Vcc - Vs. This convention remains
even without the NMOS device.

If the switch is used in an application such as interfacing
between 3.3 V and 5.0 V logic, the Vcc may be biased at a
voltage (such as 4.3 V) that is different from a power rail
voltage (such as 5.0 V) used to create the model. Just
readjust the [Voltage Range] entries (or [POWER Clamp
Reference] entries).

One fundamental assumption in the MOSFET switch model is that
it operates in a symmetrical manner. The tables and
expressions are given assuming that Vd >= Vs. If Vd < Vs,
then apply the same relationships under the assumption that
the source and drain nodes are interchanged. A consequence of
this assumption is that the Vds subparameter is constrained to
values Vds > 0. It is assumed that with Vds = 0 the currents
will be 0 mA. A further consequence of this assumption that
would be embedded in the analysis process is that the voltage
table is based on the side of the model with the lowest
voltage (and that side is defined as the source). Thus the
analysis must allow current to flow in both directions, as
would occur due to reflections when the switch is connected in
series with an unterminated transmission line.

The model data is used to create an On state relationship
between the actual drain to source current, ids, and the
actual drain to source voltage, vds:

$$ids = f(vds).$$

This functional relationship depends on the actual source
voltage Vs and can be expressed in terms of the corresponding
table currents associated with Vs (and expressed as a function
of Vtable).

If only one [Series MOSFET] table is supplied (as a first
order approximation), the functional relationship is assumed
to be linearly related to the table drain to source current,
Ids, for the given Vds subparameter value and located at the
existing gate to source voltage value Vtable. This table
current is denoted as Ids(Vtable, Vds). The functional
relationship becomes:

$$ids = Ids(Vtable, Vds) * vds/Vds.$$

```
|
|               More than one [Series MOSFET] table is permitted, but it is
|               simulator dependent how the data will be used.  Each
|               successive [Series MOSFET] table must have a different
|               subparameter value for Vds.  The number of tables must not
|               exceed 100.
|
|               C_comp values are ignored for [Series MOSFET] models.

|==============================================================================
|      Keyword:    [Ramp]
|     Required:    Yes, except for inputs, terminators, Series and Series_switch
|                  model types
| Description:     Defines the rise and fall times of a buffer.  The ramp rate
|                  does not include packaging but does include the effects of the
|                  C_comp or C_comp_* parameters.
|  Sub-Params:     dV/dt_r, dV/dt_f, R_load
| Usage Rules:     The rise and fall time is defined as the time it takes the
|                  output to go from 20% to 80% of its final value.  The ramp
|                  rate is defined as:
|
|                          dV         20% to 80% voltage swing
|                          -- = ----------------------------------------
|                          dt   Time it takes to swing the above voltage
|
|                  The ramp rate must be specified as an explicit fraction and
|                  must not be reduced.  The [Ramp] values can use "NA" for the
|                  min and max values only.  The R_load subparameter is optional
|                  if the default 50 ohm load is used.  The R_load subparameter
|                  is required if a non-standard load is used.
|------------------------------------------------------------------------------
[Ramp]
| variable        typ             min             max

R_load = 300ohms
|
|==============================================================================
|     Keywords:    [Rising Waveform], [Falling Waveform]
|     Required:    No
| Description:     Describes the shape of the rising and falling edge waveforms
|                  of a driver.
|  Sub-Params:     R_fixture, V_fixture, V_fixture_min, V_fixture_max, C_fixture,
|                  L_fixture, R_dut, L_dut, C_dut
| Usage Rules:     Each [Rising Waveform] and [Falling Waveform] keyword
|                  introduces a table of voltage versus time points that describe
|                  the shape of an output waveform.  These voltage versus time
|                  points are taken under the conditions specified by the
|                  R/L/C/V_fixture and R/L/C_dut subparameters.  The table itself
|                  consists of one column of time points, then three columns of
|                  voltage points in the standard typ, min, and max format.  The
|                  four entries must be placed on a single line and must be
|                  separated by at least one white space.  All four columns are
|                  required.  However, data is only required in the typical
|                  column.  If minimum or maximum data is not available, use the
|                  reserved word "NA".  The first value in the time column need
|                  not be '0'.  Time values must increase as one parses down the
|                  table.  The waveform table can contain a maximum of 1000 data
|                  rows.  A maximum of 100 waveform tables are allowed per model.
|
|                  Note that for backward compatibility, the existing [Ramp]
```

keyword is still required. The data in the waveform table is
taken with the effects of the C_comp parameter included.

A waveform table must include the entire waveform; i.e., the
first entry (or entries) in a voltage column must be the DC
voltage of the output before switching and the last entry (or
entries) of the column must be the final DC value of the
output after switching. Each table must contain at least two
entries. Thus, numerical values are required for the first
and last entries of any column containing numerical data.

The data in all of the waveform tables should be time
correlated. In other words, the edge data in each of the
tables (rising and falling) should be entered with respect to
a single point in time when the input stimulus is assumed to
have initiated a logic transition. All waveform extractions
should reference a common input stimulus time in order to
provide a sufficiently accurate alignment of waveforms. The
first line in each waveform table should be assumed to be the
reference point in time corresponding to a logic transition.
For example, assume that some internal rising edge logic
transition starts at time = 0. Then a rising edge
voltage-time table might be created starting at time zero.
The first several table entries might be some "lead-in" time
caused by some undefined internal buffer delay before the
voltage actually starts transitioning. The falling edge
stimulus (for the purpose of setting reference time for the
voltage-time table) should also start at time = 0. And, the
falling edge voltage-time table would be created starting at
time zero with a possibly different amount of "lead-in" time
caused by a possibly different but corresponding falling edge
internal buffer delay.   Any actual device differences in
internal buffer delay time between rising and falling edges
should appear as differing lead-in times between the rising
and the falling waveforms in the tables just as any
differences in actual device rise and fall times appear as
differing voltage-time entries in the tables.

A [Model] specification can contain more than one rising edge
or falling edge waveform table. However, each new table must
begin with the appropriate keyword and subparameter list as
shown below. If more than one rising or falling edge waveform
table is present, then the data in each of the respective
tables must be time correlated. In other words, the rising
(falling) edge data in each of the rising (falling) edge
waveform tables must be entered with respect to a common
reference point on the input stimulus waveform.

The 'fixture' subparameters specify the loading conditions
under which the waveform is taken. The R_dut, C_dut, and
L_dut subparameters are analogous to the package parameters
R_pkg, C_pkg, and L_pkg and are used if the waveform includes
the effects of pin inductance/capacitance. The diagram below
shows the interconnection of these elements.

```
|                     PACKAGE              |  TEST FIXTURE
|                                          |
|        _____                        |
|       |  DUT     |   L_dut    R_dut      |  L_fixture  R_fixture
|       |  die     |---@@@@@--/\/\/\--o-----|--@@@@---o---/\/\/\----- V_fixture
|       |_____|                 |     |        |          |
|                                     |     |        |          |
|                                     |     |        |          |
|                                     |     |        |          |
|                       C_dut ===     |     |         === C_fixture
|                                 |     |     |        |
|                                 |     |     |        |
|                                GND    |    GND
|
```
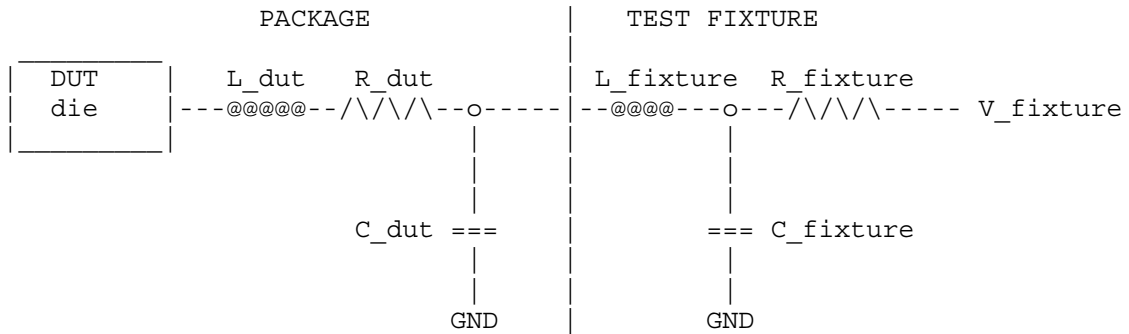

| NOTE: The use of L_dut, R_dut, and C_dut is strongly
| discouraged in developing Waveform data from simulation
| models. Some simulators may ignore these parameters because
| they may introduce numerical time constant artifacts.
|
| Only the R_fixture and V_fixture subparameters are required,
| the rest of the subparameters are optional. If a subparameter
| is not used, its value defaults to zero. The subparameters
| must appear in the text after the keyword and before the first
| row of the waveform table.
|
| V_fixture defines the voltage for typ, min, and max supply
| conditions. However, when the fixture voltage is related to
| the power supply voltages, then the subparameters
| V_fixture_min and V_fixture_max can be used to further specify
| the fixture voltage for min and max supply voltages.
|
| NOTE: Test fixtures with R_fixture and V_fixture,
| V_fixture_min, and V_fixture_max only are strongly encouraged
| because they provide the BEST set of data needed to produce
| the best model for simulation. C_fixture and L_fixture can be
| used to produce waveforms which describe the typical test case
| setups for reference.
|
| NOTE: In most cases two [Rising Waveform] tables and two
| [Falling Waveform] tables will be necessary for accurate
| modeling.
|
| All tables assume that the die capacitance is included.
| Potential numerical problems associated with processing the
| data using the effective C_comp (or C_comp_* values as
| appropriate) for effective die capacitance may be handled
| differently among simulators.
|--

|
|===============================================================================
|     Keyword:   [Test Data]
|    Required:   No
| Description:   Indicates the beginning of a set of Golden Waveforms and
|                references the conditions under which they were derived. An
|                IBIS file may contain any number of [Test Data] sections
|                representing different driver and load combinations.
|                Golden Waveforms are a set of waveforms simulated
|                using known ideal test loads.  They are useful in verifying
|                the accuracy of behavioral simulation results against the
|                transistor level circuit model from which the IBIS model
|                parameters originated.
|  Sub-Params:   Test_data_type, Driver_model, Driver_model_inv, Test_load
| Usage Rules:   The name following the [Test Data] keyword is required.  It
|                allows a tool to select which data to analyze.
|
|                The Test_data_type subparameter is required, and its value
|                must be either "Single_ended" or "Differential."  The value of
|                Test_data_type must match the value of Test_load_type found in
|                the load called by Test_load.
|
|                The Driver_model subparameter is required.  Its value
|                specifies the "device-under-test" and must be a valid [Model]
|                name.  Driver_model_inv is only legal if Test_data_type is
|                Differential.  Driver_model_inv is not required but may be
|                used in the case in which a differential driver uses two
|                different models for the inverting and non-inverting pins.
```
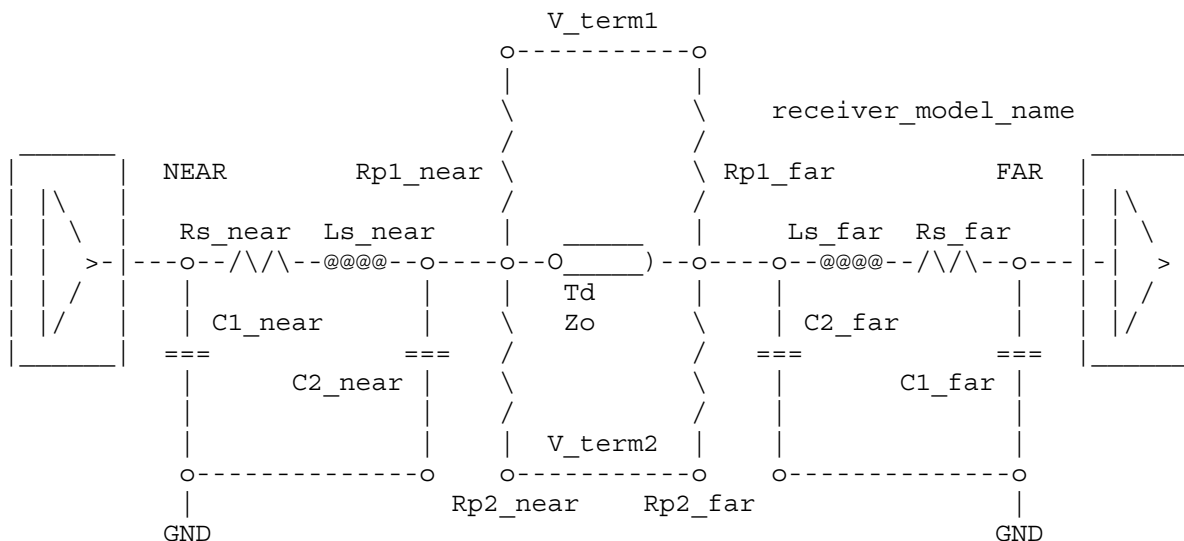

```
|
|               The Test_load subparameter is required and indicates which
|               [Test Load] was used to derive the Golden Waveforms. It must
|               reference a valid [Test Load] name.
|-------------------------------------------------------------------------------
[Test Data] Data1
Test_data_type Single_ended
Driver_model Buffer1
Test_load Load1
|
|===============================================================================
|     Keywords:  [Rising Waveform Near], [Falling Waveform Near],
|                [Rising Waveform Far], [Falling Waveform Far],
|                [Diff Rising Waveform Near], [Diff Falling Waveform Near],
|                [Diff Rising Waveform Far], [Diff Falling Waveform Far]
|     Required:  At least one Rising/Falling waveform is required under the
|                scope of the [Test Data] keyword.
|  Description:  Describes the shape of the rising and falling Golden Waveforms
|                of a given driver and a given [Test Load] measured at the
|                driver I/O pad (near) or receiver I/O pad (far).  A model
|                developer may use the [Rising Waveform Near/Far] and [Falling
|                Waveform Near/Far] keywords to document Golden Waveforms whose
|                purpose is to facilitate the correlation of reference
|                waveforms and behavioral simulations.
|  Usage Rules:  The process, temperature, and voltage conditions under which
|                the Golden Waveforms are generated must be identical to those
|                used to generate the I-V and V-T tables. The Golden Waveforms
|                must be generated using unpackaged driver and receiver models.
|                The simulator must NOT use the Golden Waveform tables in the
|                construction of its internal stimulus function.
|
|                The tables must conform to the format described under the
|                [Rising Waveform] and [Falling Waveform] keywords.
|
|                Both differential and single-ended waveforms are allowed
|                regardless of the value of Test_data_type.  If Test_data_type
|                is Singled_ended then differential waveforms will be ignored.
|                If Test_data_type is Differential, a single-ended waveform
|                refers to the model specified by Driver_model and the
|                non-inverting driver output.

|==
| **Keyword: [Test Load]**
| Required: No
| Description: Defines a generic test load network and its associated
| electrical parameters for reference by Golden Waveforms
| under the [Test Data] keyword. The Golden Waveform
| tables correspond to a given [Test Load] which is specified
| by the Test_load subparameter under the [Test Data] keyword.
| Sub-Params: Test_load_type, C1_near, Rs_near, Ls_near, C2_near, Rp1_near,
| Rp2_near, Td, Zo, Rp1_far, Rp2_far, C2_far, Ls_far, Rs_far,
| C1_far, V_term1, V_term2, Receiver_model, Receiver_model_inv,
| R_diff_near, R_diff_far.
| Usage Rules: The Test_load_type subparameter is required, and its value
| must be either "Single_ended" or "Differential."
|
| The subparameters specify the electrical parameters
| associated with a fixed generic test load. The diagram
| below describes the single_ended test load.
|
| All subparameters except Test_load_type are optional. If
| omitted, series elements are shorted and shunt elements are
| opened by default.
|

page 56

```
|
|
|                 If the Td subparameter is present, then the Zo subparameter
|                 must also be present.  If the Td subparameter is not present,
|                 then the simulator must remove the transmission line from
|                 the network and short the two nodes to which it was
|                 connected.
|
|                 V_term1 defines the termination voltage for parallel
|                 termination resistors Rp1_near and Rp1_far.  This voltage
|                 is not related to the [Voltage Range] keyword.
|                 If either Rp1_near or Rp1_far is used, then V_term1 must
|                 also be used.
|
|                 V_term2 defines the termination voltage for parallel
|                 termination resistors Rp2_near and Rp2_far.
|                 If either Rp2_near or Rp2_far is used, then V_term2 must
|                 also be used.
|
|                 Receiver_model is optional and indicates which, if any,
|                 receiver is connected to the far end node. If not used, the
|                 network defaults to no receiver.
|
|                 Receiver_model_inv is not required but may be used in the
|                 case in which a differential receiver uses two different
|                 models for the inverting and non-inverting pins.
|                 Receiver_model_inv is ignored if Test_load_type is
|                 Single-ended.
|
|                 If Test_load_type is Differential, then the test load is a
|                 pair of the above circuits.  If the R_diff_near or R_diff_far
|                 subparameter is used, a resistor is connected between the
|                 near or far nodes of the two circuits.  If Test_load_type is
|                 Single_ended, R_diff_near and R_diff_far are ignored.

|================================================================================
|================================================================================
|
| The [Add Submodel] keyword can be used under a top-level [Model] keyword to
| to add special-purpose functionality to the existing top-level model.  This
| section describes the structure of the top-level model and the submodel.
|
| TOP-LEVEL MODEL:
|
| When special-purpose functional detail is needed, the top-level model can
| call one or more submodels.  The [Add Submodel] keyword is positioned
| after the initial set of required and optional subparameters of the [Model]
| keyword and among the keywords under [Model].
|
| The [Add Submodel] keyword lists of name of each submodel and the permitted
| mode (Driving, Non-Driving or All) under which each added submodel is used.
|
| SUBMODEL:
|
| A submodel is defined using the [Submodel] keyword.  It contains a subset
| of keywords and subparameters used for the [Model] keyword along with other
| keywords and subparameters that are needed for the added functionality.
|
| The [Submodel] and [Submodel Spec] keywords are defined first since they
| are used for all submodels.
|
| The only required subparameter in [Submodel] is Submodel_type to define the
| list of submodel types.  No subparameters under [Model] are permitted under
| the [Submodel] keyword.
|
| The following set of keywords that are defined under the [Model] keyword are
| supported by the [Submodel] keyword:
|
| [Pulldown]
| [Pullup]
| [GND Clamp]
| [POWER Clamp]
| [Ramp]
| [Rising Waveform]
| [Falling Waveform]
|
| The [Voltage Range], [Pullup Reference], [Pulldown Reference], [GND Clamp
| Reference], and [POWER Clamp Reference] keywords are not permitted.  The
| voltage settings are inherited from the top-level model.
|
| These additional keywords are used only for the [Submodel] are documented
| in this section:
|
| [Submodel Spec]
| [GND Pulse Table]
| [POWER Pulse Table]
```

```
|
| The application of these keywords depends upon the Submodel_type entries
| listed below:
|
| Dynamic_clamp
| Bus_hold
| Fall_back
|
| Permitted keywords that are not defined for any of these submodel types are
| ignored.  The rules for what set of keywords are required are found under
| the Dynamic Clamp, Bus Hold, and Fall Back headings of this section.
|
|==============================================================================
|     Keyword:   [Submodel]
|    Required:   No
| Description:   Used to define a submodel, and its attributes.
|  Sub-Params:   Submodel_type
| Usage Rules:   Each submodel must begin with the keyword [Submodel].  The
|                submodel name must match the one that is listed under an
|                [Add Submodel] keyword and must not contain more than 20
|                characters.  A .ibs file must contain enough [Submodel]
|                keywords to cover all of the model names specified under the
|                [Add Submodel] keyword.
|
|                Submodel_type subparameter is required and must be one of the
|                following:
|
|                Dynamic_clamp, Bus_hold, Fall_back
|
|                The C_comp subparameter is not permitted under the [Submodel]
|                keyword.  The total effective die capacitance including the
|                submodel contributions are provided in the top-level model.
|
| Other Notes:   The following list of keywords that are defined under the
|                [Model] keyword can be used under [Submodel]:  [Pulldown],
|                [Pullup], [GND Clamp], [POWER Clamp], [Ramp], [Rising
|                Waveform], and [Falling Waveform].
|
|                The following list of additional keywords can be used:
|                [Submodel Spec], [GND Pulse Table], and [POWER Pulse Table].
|------------------------------------------------------------------------------
[Submodel]      Dynamic_clamp1
Submodel_type   Dynamic_clamp
|
|==============================================================================
|     Keyword:   [Submodel Spec]
|    Required:   No
| Description:   The [Submodel Spec] keyword defines four columns under which
|                specification and information subparameters are defined for
|                submodels.
|  Sub-Params:   V_trigger_r, V_trigger_f, Off_delay
| Usage Rules:   The [Submodel Spec] is to be used only with submodels.
|
|                The following subparameters are used:
|                  V_trigger_r          Rising edge trigger voltage
|                  V_trigger_f          Falling edge trigger voltage
|                  Off_delay            Turn-off delay from V_trigger_r or
|                                       V_trigger_f
```

```
|
|              For each subparameter contained in the first column, the
|              remaining three hold its typical, minimum and maximum values.
|              The entries of typical, minimum and maximum be must be placed
|              on a single line and must be separated by at least one white
|              space.  All four columns are required under the [Submodel
|              Spec] keyword.  However, data is required only in the typical
|              column.  If minimum and/or maximum values are not available,
|              the reserved word "NA" must be used to indicate the typical
|              value by default.
|
|              The values in the minimum and maximum columns usually
|              correspond to the values in the same columns for the inherited
|              top-level voltage range or reference voltages in the top-level
|              model.  The V_trigger_r and V_trigger_f subparameters should
|              hold values in the minimum and maximum columns that correspond
|              to the voltage range or reference voltages of the top-level
|              model.  The Off_delay subparameter, however, is an exception
|              to this rule because in some cases it may be completely or
|              or partially independent from supply voltages and/or
|              manufacturing process variations.  Therefore the minimum and
|              maximum entries for the Off_delay subparameter should be
|              ordered simply by their magnitude.
|
|              Unless noted, each [Submodel Spec] subparameter is independent
|              of any other subparameter.
|
|              V_trigger_r, V_trigger_f rules:
|
|              The voltage trigger values for the rising and falling edges
|              provide the starting time when an action is initiated.
|
|              Off_delay rules:
|
|              The functionality of the Off_delay subparameter is to provide
|              an additional time related mechanism to turn off circuit
|              elements.
|
|-----------------------------------------------------------------------------
| Dynamic Clamp Example:
|
[Submodel Spec]
|    Subparameter            typ          min          max
|
V_trigger_r                  3.6          2.9          4.3 | Starts power pulse table
V_trigger_f                  1.4          1.2          1.6 | Starts gnd pulse table
|
| Bus Hold Example:
|
[Submodel Spec]
|    Subparameter            typ          min          max
V_trigger_r                  3.1          2.4          3.7 | Starts low to high
|                                                          | bus hold transition
V_trigger_f                  1.8          1.6          2.0 | Starts high to low
|                                                          | bus hold transition
|
| Bus_hold application with pullup structure triggered on and then clocked off:
|
```

```
[Submodel Spec]
|   Subparameter           typ         min         max
V_trigger_r                3.1         2.4         3.7 | Low to high transition
                                                      | triggers the turn on
                                                      | process of the pullup
V_trigger_f               -10.0       -10.0       -10.0 | Not used, so trigger
                                                      | voltages are set out
                                                      | of range
Off_delay                  5n          4n          6n | Time from rising edge
                                                      | trigger at which the
                                                      | pullup turned off
|
|================================================================================
|
| Dynamic Clamp:
|
| When the Submodel_type subparameter under the [Submodel] keyword is set to
| Dynamic_clamp, the submodel describes the dynamic clamp functionality.
|
| The [GND Pulse Table] and [POWER Pulse Table] keywords are defined.  An
| example for a complete dynamic clamp model is provided.
|
|================================================================================
|    Keywords:  [GND Pulse Table], [POWER Pulse Table]
|    Required:  No
| Description:  Used to specify the offset voltage versus time of [GND Clamp]
|               and [POWER Clamp] tables within submodels.
| Usage Rules:  Each [GND Pulse Table] and [POWER Pulse Table] keyword
|               introduces a table of voltage vs. time points that describe
|               the shape of an offset voltage from the [GND Clamp Reference]
|               voltage (or default ground) or the [POWER Clamp Reference]
|               voltage (or default [Voltage Range] voltage).  Note, these
|               voltage values are inherited from the top-level model.
|
|               The table itself consists of one column of time points, then
|               three columns of voltage points in the standard typ, min, and
|               max format.  The four entries must be placed on a single line
|               and must be separated by at least one white space.  All four
|               columns are required.  However, data is only required in the
|               typical column.  If minimum or maximum data is not available,
|               use the reserved word "NA".  Time values must increase as one
|               parses down the table.  The waveform table can contain of
|               maximum of 100 rows.
|
|               Each table must contain at least two entries.  Thus, numerical
|               values are required for the first and last entries of any
|               column containing numerical data.
|
|               The voltage entries in both the [Gnd Pulse Table] and [POWER
|               Pulse Table] tables are directly measured offsets.  At each
|               instance, the [Gnd Pulse Table] voltage is ADDED to the [GND
|               Clamp] table voltages to provide the shifted table voltages.
|               At each instance, the [POWER Pulse Table] voltage is
|               SUBTRACTED (because of polarity conventions) from the [POWER
|               Clamp] table voltages to provide the shifted table voltages.
|
|               Only one [GND Pulse Table] and one [POWER Pulse Table] are
|               allowed per model.
```

The [GND Pulse Table] and [POWER Pulse Table] interact with
[Submodel Spec] subparameters V_trigger_f and V_trigger_r.
Several modes of operation exist based on whether a pulse
table and its corresponding trigger subparameter are given.
These modes are classified as triggered and static.

Triggered Mode:

For triggered mode a pulse table must exist and include the
entire waveform; i.e., the first entry (or entries) in a
voltage column must be equal to the last entry.

Also, a corresponding [Submodel Spec] V_trigger_* subparameter
must exist. The triggered interaction is described:

The V_trigger_f subparameter under [Submodel Spec] is used
to detect when the falling edge waveform at the die passes
the trigger voltage. At that time the [Gnd Pulse Table]
operation starts. Similarly, the V_trigger_r subparameter is
used to detect when the rising edge waveform at the die passes
the trigger voltage. At that time [POWER Pulse Table]
operation starts. The [GND Pulse Table] dependency is shown
below:

              |_   [GND Pulse Table] operation starts at this time
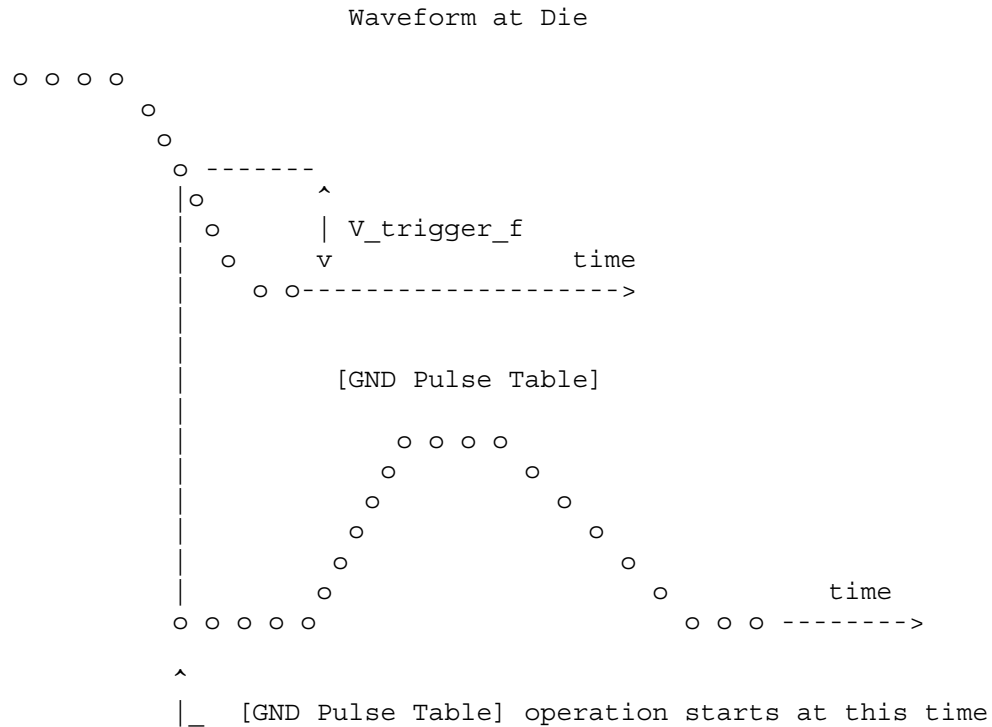

The V_trigger_r and [POWER Pulse Table] operate in a similar manner. When
the V_trigger_r voltage value is reached on the rising edge, the [POWER
Pulse Table] is started. Normally the offset voltage entries in the [POWER
Pulse Table] are negative.

```
| Static Mode:
|
| When the [GND Pulse Table] keyword does not exist, but the added model
| [GND Clamp] table does exist, the added model [GND Clamp] is used directly.
| Similarly, when the [POWER Pulse Table] keyword does not exist, but the
| added model [POWER Clamp] table does exist, the added model [POWER Clamp]
| is used directly.
|
| This mode provides additional fixed clamping to an I/O_* buffer or a
| 3-state buffer when it is used as a driver.
|------------------------------------------------------------------------

|===============================================================================
|
| Bus Hold:
|
| When the Submodel_type subparameter under the [Submodel] keyword is set to
| Bus_hold, the added model describes the bus hold functionality.  However,
| while described in terms of bus hold functionality, active terminators
| can also be modeled.
```

Existing keywords and subparameters are used to describe bus hold models.
The [Pullup] and [Pulldown] tables both are used to define an internal
buffer that is triggered to switch to its opposite state. This switching
transition is specified by a [Ramp] keyword or by the [Rising Waveform] and
[Falling Waveform] keywords. The usage rules for these keywords are the
same as under the [Model] keyword. In particular, at least either the
[Pullup] or [Pulldown] keyword is required. Also, the [Ramp] keyword is
required, even if the [Rising Waveform] and [Falling Waveform] tables exist.
However, the voltage ranges and reference voltages are inherited from the
top-level model.

For bus hold submodels, the [Submodel Spec] keyword, V_trigger_r, and
V_trigger_f are required. The Off_delay subparameter is optional, and can
only be used if the submodel consists of a pullup or a pulldown structure
only, and not both. Devices which have both pullup and pulldown structures
controlled in this fashion can be modeled using two submodels, one for each
half of the circuit.

The transition is triggered by action at the die using the [Submodel Spec]
V_trigger_r and V_trigger_f subparameters is described next. In all
subsequent discussions, "low" means the pulldown structure is on or active,
and the pullup structure is off or inactive if either or both exist. The
opposite settings are referred to as "high".

If the starting voltage is below V_trigger_f, then the bus hold model is set
to the low state causing additional pulldown current. If the starting
voltage is above V_trigger_r, the bus hold model is set to the high state
for additional pullup current.

Under some unusual cases, the above conditions can be both met or not met at
all. To resolve this, the EDA tool should compute the starting voltage with
the bus hold model set to low. If the starting voltage is equal to or less
than the average of V_trigger_r and V_trigger_f, keep the bus hold model
in the low state. Otherwise, set the bus hold model to the high state.

When the input passes through V_trigger_f during a high-to-low transition
at the die, the bus hold output switches to the low state. Similarly, when
the input passes though V_trigger_r during a low-to-high transition at the
die, the bus hold output switches to the high state.

If the bus hold submodel has a pullup structure only, V_trigger_r provides
the time when its pullup is turned on and V_trigger_f or Off_delay provides
the time when it is turned off, whichever occurs first. Similarly, if the
submodel has a pulldown structure only, V_trigger_f provides the time when
its pulldown is turned on and V_trigger_r or Off_delay provides the time
when it is turned off, whichever occurs first. The required V_trigger_r
and V_trigger_f voltage entries can be set to values outside of the input
signal range if the pullup or pulldown structures are to be held on until
the Off_delay turns them off.

The starting mode for each of the submodels which include the Off_delay
subparameter of the [Submodel Spec] keyword is the off state. Also, while
two submodels provide the desired operation, either of the submodels may
exist without the other to simulate turning on and off only a pullup or a
pulldown current.

The following tables summarizes the bus hold initial and switching

```
| transitions:
|
|    BUS HOLD WITHOUT OFF_DELAY:
|
|       Initialization:
|
|          Initial Vdie Value                  Initial Bus Hold
|                                              Submodel State
|          ------------------------------    ----------------
|          <= V_trigger_r & < V_trigger_f    low
|          => V_trigger_f & > V_trigger_r    high
|
|          <= (V_trigger_f + V_trigger_r)/2  low   | Recommendations if neither
|          > (V_trigger_f + V_trigger_r)/2   high  | or both conditions above
|                                                  | are satisifed
|
|
|       Transitions:
|
|          Prior Bus Hold    Vdie transition  Bus Hold
|          Submodel State    through          Transition
|                            V_trigger_r/f
|          --------------    ---------------  -----------
|          low               V_trigger_r      low-to-high
|          low               V_trigger_f      no change
|          high              V_trigger_r      no change
|          high              V_trigger_f      high-to-low
|
|    BUS HOLD WITH OFF_DELAY (REQUIRES EITHER [PULLUP] or [PULLDOWN] ONLY):
|
|       Initialization:
|
|          [Pullup] or       Initial Bus Hold
|          [Pulldown] Table  Submodel State (Off Mode)
|          ----------------  -------------------------
|          [Pullup]          low
|          [Pulldown]        high
|
|       Transitions:
|
|          Prior Bus Hold    Vdie transition  Bus Hold      Off_delay
|          Submodel State    through          Transition    Transition
|                            V_trigger_r/f
|          --------------    ---------------  -----------   -----------
|          low               V_trigger_r      low-to-high   high-to-low
|          low               V_trigger_f      no change     no change
|          high              V_trigger_r      no change     no change
|          high              V_trigger_f      high-to-low   low-to-high
|
|       Note, if Vdie passes again through the V_trigger_r/f thresholds
|       before the Off_delay time is reached, the bus hold state follows the
|       change documented in the first table, overriding the Off_delay
|       transition.
|
| No additional keywords are needed for this functionality.

  |============================================================================
  |
  | Fall Back:
  |
  | When the Submodel_type subparameter under the [Submodel] keyword is set to
  | Fall_back, the added model describes the fall back functionality.  This
  | submodel can be used to model drivers that reduce their strengths and
  | increase their output impedances during their transitions.  The fall back
  | submodel is specified in a restrictive manner consistent with its intended
  | use with a driver model operating only in Driving mode.  In a Non-Driving
  | mode, no action is specified.  For example, a fall back submodel added to
  | and Input or Terminator model would be inactive.
  |
  | Existing keywords and subparameters are used to describe fall back models.
  | However, only one [Pullup] or [Pulldown] table, but not both, is allowed.
  | The switching transition is specified by a [Ramp] keyword or by the [Rising
  | Waveform] and [Falling Waveform] keywords.  The [Ramp] keyword is required,
  | even if the [Rising Waveform] and [Falling Waveform] tables exist.  However,
  | the voltage ranges and reference voltages are inherited from the top-level
  | model.
  |
  | For fall back submodels, the [Submodel Spec] keyword, V_trigger_r, and
  | V_trigger_f are required.  Unlike the bus hold model, the Off_delay
```

subparameter is not permitted. Devices which have both pullup and pulldown
structures can be modeled using two submodels, one for the rising cycle
and one for the falling cycle.

In all following discussion, "low" means the pulldown structure is on or
active, and the pullup structure is off or inactive. The opposite settings
are referred to as "high".

The transition is triggered by action at the die using the [Submodel Spec]
V_trigger_r and V_trigger_f subparameters. The initialization and
transitions are set as follows:

    INITIAL STATE:

      [Pullup] or [Pulldown] Initial Fall Back
      Table   Submodel State (Off Mode)
      ---------------------- -------------------------
      [Pullup]   low
      [Pulldown]   high

    DRIVER RISING CYCLE:

      Prior Vdie   Rising Edge   Vdie > V_trigger_r
      State   Transition   Transition
      ----- --------------   -----------   ------------------
      low   <= V_trigger_r   low-to-high   high-to-low
             > V_trigger_r   stays low   stays low

      high   <= V_trigger_r   stays high   high-to-low
             > V_trigger_r   stays high   stays high

    DRIVER FALLING CYCLE:

      Prior Vdie   Falling Edge Vdie < V_trigger_f
      State   Transition   Transition
      ----- --------------   ------------ ------------------
      high   => V_trigger_f   high-to-low   low-to-high
             < V_trigger_f   stays high   stays high

      low   => V_trigger_f   stays low   low-to-high
             < V_trigger_f   stays low   stays low

One application is to configure the submodel with only a pullup structure.
At the beginning of the rising edge cycle, the pullup is turned on to the
high state. When the die voltage passes V_trigger_r, the pullup structure
is turned off. Because only the pullup structure is used, the off state is
low corresponding to a high-Z state. During the falling transition, the
pullup remains in the high-Z state if the V_trigger_f is set out of range to
avoid setting the submodel to the high state. So a temporary boost in drive
occurs only during the first part of the rising cycle.

A similar submodel consisting of only a pulldown structure could be
constructed to provide added drive strength only at the beginning of the
falling cycle. The complete IBIS model would have both submodels to give
added drive strength for both the start of the rising and the start of the
falling cycles.

```
| No additional keywords are needed for this functionality.

|
| INTRODUCTION:
|
| The SPICE, VHDL-AMS and Verilog-AMS languages are supported by IBIS.  This
| chapter describes how models written in these languages can be referenced
| and used by IBIS files.
|
| The language extensions use the following keywords within the IBIS
| framework:
|
|    [External Circuit]       - References enhanced descriptions of structures
|    [End External Circuit]     on the die, including digital and/or analog,
|                               active and/or passive circuits
|
|
|    [External Model]         - Same as [External Circuit], except limited to
|    [End External Model]       the connection format and usage of the [Model]
|                               keyword, with one additional feature added:
|                               support for true differential buffers
|
|
|    [Node Declarations]      - Lists on-die connection points related to
|    [End Node Declarations]    the [Circuit Call] keyword
|
|
|    [Circuit Call]           - Instantiates [External Circuit]s and connects
|    [End Circuit Call]         them to each other and/or die pads
|
| The placement of these keywords within the hierarchy of IBIS is shown in the
| following diagram:
|
|
|    |-- [Component]
|    |   | ...
|    |   |-- [Node Declarations]
|    |   |-- [End Node Declarations]
|    |   | ...
|    |   | ...
|    |   |-- [Circuit Call]
|    |   |-- [End Circuit Call]
|    |   | ...
|    | ...
|    |-- [Model]
|    |   | ...
|    |   |-- [External Model]
|    |   |-- [End External Model]
|    |   | ...
|    | ...
|    |-- [External Circuit]
|    |-- [End External Circuit]
|    | ...
|
```

Figure 1

LANGUAGES SUPPORTED:

IBIS files can reference other files which are written using the SPICE,
VHDL-AMS, or Verilog-AMS languages. In this document, these languages are
defined as follows:

"SPICE" refers to SPICE 3, Version 3F5 developed by the University of
California at Berkeley, California. Many vendor-specific EDA tools are
compatible with most or all of this version.

"VHDL-AMS" refers to "IEEE Standard VHDL Analog and Mixed-Signal
Extensions", approved March 18, 1999 by the IEEE-SA Standards Board and
designated IEEE Std. 1076.1-1999.

"Verilog-AMS" refers to the Analog and Mixed-Signal Extensions to
Verilog-HDL as documented in the Verilog-AMS Language Reference, Version
2.0. This document is maintained by Accellera (formerly Open Verilog
International), an independent organization. Verilog-AMS is a superset
that includes Verilog-A and the Verilog Hardware Description Language
IEEE 1364-2001.

In addition the "IEEE Standard Multivalue Logic System for VHDL Model
Interoperability (Std_logic_1164)" designated IEEE Std. 1164-1993 is
required to promote common digital data types.

Note that, for the purposes of this section, keywords, subparameters and
other data used without reference to the external languages just described
are referred to collectively as "native" IBIS.

OVERVIEW:

The four keyword pairs discussed in this chapter can be separated into two
groups based on their functionalities. The [External Model], [End External
Model], [External Circuit] and [End External Circuit] keywords are used as
pointers to the models described by one of the external languages. The
[Node Declaration], [End Node Declaration], [Circuit Call], and [End
Circuit Call] keywords are used to describe how [External Circuit]s are
connected to each other and/or to the die pads.

The [External Model] and [External Circuit] keywords are very similar in
that they both support the same external languages, and they can both be
used to describe passive and/or active circuitry. The key difference
between the two keywords is that [External Model] can only be placed under
the [Model] keyword, while [External Circuit] can only be placed outside the
[Model] keyword. This is illustrated in Figure 1 above.

The intent behind [External Model] is to provide an upgrade path from native
native IBIS [Model]s to the external languages (one exception to this is the
support for true differential buffers). Thus, the [External Model] keyword
can be used to replace the usual I-V and V-T tables, C_comp, C_comp_pullup,
C_comp_pulldown, C_comp_power_clamp, C_comp_gnd_clamp subparameters, [Ramp],
[Driver Schedule], [Submodel] keywords, etc. of a [Model] by any modeling
technique that the external languages allow. For [External Model]s, the
connectivity, test load and specification parameters (such as Vinh and Vinl)
are preserved from the [Model] keyword and the simulator is expected to

carry out the same type of connections and measurements as is usually done
with the [Model] keyword. The only difference is that the model itself is
described by an external language.

In the case of the [External Circuit], however, one can model a circuit
having any number of ports (see definitions below). For example, the ports
may include impedance or buffer strength selection controls in addition to
the usual signal and supply connections. The connectivity of an [External
Circuit] is defined by the [Node Declaration] and [Circuit Call] keywords.
Currently, the test loads and measurement parameters for an [External
Circuit] can only be defined inside the model description itself. The
results of measurements can be reported to the user or tool via other means.

The [Circuit Call] keyword acts similarly to subcircuit calls in SPICE,
instantiating the various [External Circuit]s and connecting them together.
Please note that models described by the [External Model] keyword are
connected according to the rules and assumptions of the [Model] keyword.
[Circuit Call] is not necessary for these cases and must not be used.

DEFINITIONS:

For the purposes of this document, several general terms are defined below.

                      circuit - any arbitrary collection of active or
                                passive electrical elements treated as a unit

                         node - any electrical connection point;
                                also called die node (may be digital or
                                analog; may be a connection internal to a
                                circuit or between circuits)

                          pad - a special case of a node. A pad connects
                                a buffer or other circuitry to a package;
                                also called die pad.

                         port - access point in an [External Model] or
                                [External Circuit] definition for digital or
                                analog signals

pseudo-differential circuits - combination of two single-ended circuits
                                which drive and/or receive complementary
                                signals, but where no internal current
                                relationship exists between them

  true differential circuits - circuits where a current relationship exists
                                between two output or inputs which drive or
                                receive complementary signals

GENERAL ASSUMPTIONS:

Ports under [Model]s:

The use of ports under native IBIS must be understood before the multi-
lingual extensions can be correctly applied. The [Model] keyword assumes,
but does not explicitly require naming ports on circuits. These ports are

page 75

automatically connected by IBIS-compliant tools without action by the user.
For example, the [Voltage Reference] keyword implies the existence of power
supply rails which are connected to the power supply ports of the circuit
described by the [Model] keyword.

For multi-lingual modeling, ports must be explicitly named in the
[External Model] or [External Circuit]; the ports are no longer assumed by
EDA tools. To preserve compatibility with the assumptions of [Model], a
list of pre-defined port names has been created where the ports are reserved
reserved with fixed functionality. These reserved ports are defined in the
table below.

```
   Port Name       Description
   =========       ==========================
 1 D_drive         Digital input to a model unit
 2 D_enable        Digital enable for a model unit
 3 D_receive       Digital receive port of a model unit, based on data on
                   A_signal (and/or A_signal_pos and A_signal_neg)
 4 A_puref         Voltage reference port for pullup structure
 5 A_pcref         Voltage reference port for power clamp structure
 6 A_pdref         Voltage reference port for pulldown structure
 7 A_gcref         Voltage reference port for ground clamp structure
 8 A_signal        I/O signal port for a model unit
 9 A_extref        External reference voltage port
10 D_switch        Digital input for control of a series switch model
11 A_gnd           Global reference voltage port
12 A_pos           Non-inverting port for series or series switch models
13 A_neg           Inverting port for series or series switch models
14 A_signal_pos    Non-inverting port of a differential model
15 A_signal_neg    Inverting port of a differential model
```

The first letter of the port name designates it as either digital ("D") or
analog ("A"). Reserved ports 1 through 13 listed above are assumed or
implied under the native IBIS [Model] keyword. Again, for multi-lingual
models, these ports must be explicitly assigned by the user in the model
if their functions are to be used. A_gnd is a universal reference node,
similar to SPICE ideal node "0." Ports 14 and 15 are only available
under [External Model] for support of true differential buffers.

Under the [Model] description, power and ground reference ports are created
and connected by IBIS-compliant tools as defined by the [Power Clamp
Reference], [GND Clamp Reference], [Pullup Reference], [Pulldown Reference]
and/or [Voltage Range] keywords. The A_signal port is connected to the die
pad, to drive or receive an analog signal.

Ports under [External Model]s:

The [External Model] keyword may only appear under the [Model] keyword and
it may only use the same ports as assumed with the native IBIS [Model]
keyword. However, [External Model] requires that reserved ports be
explicitly declared in the referenced language(s); tools will continue to
assume the connections to these ports.

For [External Model], reserved analog ports are usually assumed to be die
pads. These ports would be connected to the component pins through [Package
Model]s or [Pin] parasitics. Digital ports under [External Model] would
connect to other internal digital circuitry.

Drawings of two standard [Model] structures -- an I/O buffer and a Series
Switch -- are shown below, with their associated port names.

```
                +---------+

                |         |
                +---------+
```
Figure 3

Ports under [External Circuit]s:

The [External Circuit] keyword allows the user to define any number of ports
and port functions on a circuit. The [Circuit Call] keyword instantiates
[External Circuit]s and connects their ports to specific die nodes (this can
include pads). In this way, the ports of an [External Circuit] declaration
become specific component die nodes. Note that, if reserved digital port
names are used with an [External Circuit], those ports will be connected
automatically as defined in the port list above (under [External Circuit],
reserved analog port names do not retain particular meanings).

The diagram below illustrates the use of [External Circuit]. Buffer A is an
instance of [External Circuit] "X". Similarly, Buffer B is an instance of
[External Circuit] "Z". These instances are created through [Circuit
Call]s. [External Circuit] "Y" defines an on-die interconnect circuit.
Nodes "a" through "e" and nodes "f" through "j" are specific instances of
the ports defined for [External Circuit]s "X" and "Z". These ports become
the internal nodes of the die and must be explicitly declared with the
[Node Declaration] keyword. The "On-die Interconnect" [Circuit Call]
creates an instance of the [External Circuit] "Y" and connects the instance
with the appropriate power, signal, and ground die pads. The "A" and "B"
[Circuit Call]s connect the individual ports of each buffer instance to the
"On-die Interconnect" [Circuit Call].

Note that the "Analog Buffer Control" signal is connected directly to the
pad for pin 3. This connection is also made through an entry under the
[Circuit Call] keyword.

```
| -------------------------------------------------+
|    Buffers and interconnect instantiated and     |
|  internal nodes connected through [Circuit Call] | Die Pads
|                                                  | (map to pins through
|  [External Circuit] X    [External Circuit] Y    | package)

Figure 4

The [Model], [External Model] and [External Circuit] keywords (with
[Circuit Call]s and [Node Declarations] as appropriate) may be combined
together in the same IBIS file or even within the same [Component]
description.

SPICE versus VHDL-AMS and VERILOG-AMS

The intent of native IBIS is to model the circuit block between the region
where analog signals are of interest, and the digital logic domain internal
to the component. (for the purposes of this discussion, the IBIS circuit
block is called a "model unit" in the drawings and document text below).

The multi-lingual modeling extensions maintain and expand this approach,
assuming that both digital signals and/or analog signals can move to and
from the model unit. All VHDL-AMS and Verilog-AMS models, therefore must
have digital ports and analog ports (in certain cases, digital ports may not
be required, as in the case of interconnects; see [External Circuit]
below). Routines to convert signals from one format to the other are the
responsibility of the model author.

SPICE cannot process digital signals. All SPICE input and output signals
must be in analog format. Consequently, IBIS multi-lingual models using
SPICE require analog-to-digital (A_to_D) and/or digital-to-analog (D_to_A)
converters to be provided by the EDA tool. The converter subparameters are
declared by the user, as part of the [External Model] or [External Circuit]

```

syntax, with user-defined names for the ports which connect the converters
to the analog ports of the SPICE model.  The details behind these
declarations are explained in the keyword definitions below.

To summarize, Verilog-AMS and VHDL-AMS contain all the capability needed to
ensure that a model unit consists of only digital ports and/or analog ports.
SPICE, however, needs extra data conversion, provided by the EDA tool, to
ensure that any digital signals can be correctly processed.

```

```
|===============================================================================
|
| KEYWORD DEFINITIONS:
|
|===============================================================================
|    Keywords:    [External Model], [End External Model]
|    Required:    No
| Description:    Used to reference an external file written in one of the
|                 supported languages containing an arbitrary circuit
|                 definition, but having ports that are compatible with the
|                 [Model] keyword, or having ports that are compatible with the
|                 [Model] keyword plus an additional signal port for true
|                 differential buffers.
|
|  Sub-Params:    Language, Corner, Parameters, Ports, D_to_A, A_to_D
| Usage Rules:    The [External Model] keyword must be positioned within a
|                 [Model] section and it may only appear once for each [Model]
|                 keyword in a .ibs file.  It is not permitted under the
|                 [Submodel] keyword.
|
|                 [Circuit Call] may not be used to connect an [External Model].
|
|                 A native IBIS [Model]'s data may be incomplete if the [Model]
|                 correctly references an [External Model].  Any native IBIS
|                 keywords that are used in such a case must contain
|                 syntactically correct data and subparameters according to
|                 native IBIS rules.  In all cases, [Model]s which reference
|                 [External Model]s must include the following keywords and
|                 subparameters:
|
|                    Model_type
|                    Vinh, Vinl (as appropriate to Model_type)
|                    [Voltage Range] and/or [Pullup Reference],
|                        [Pulldown Reference], [POWER Clamp Reference],
|                        [GND Clamp Reference], [External Reference]
|
|                 The following keywords and subparameters may be omitted,
|                 regardless of Model_type, from a [Model] using [External
|                 Model]:
|
|                    C_comp and/or C_comp_*
|                    [Ramp]
|                    [Pulldown], [Pullup], [POWER Clamp], [GND Clamp]
|
|
|                 Subparameter Definitions:
|
|
|                 Language:
|
|                 Accepts "SPICE", "VHDL-AMS", or "Verilog-AMS" as arguments.
|                 The Language subparameter is required and must appear only
|                 once.
|
|
|                 Corner:
|
|                 Three entries follow the Corner subparameter on each line:
```

page 80

```
corner_name file_name circuit_name
```

The corner_name entry is "Typ", "Min", or "Max". The
file_name entry points to the referenced file in the same
directory as the .ibs file.

Up to three Corner lines are permitted. A "Typ" line is
required. If "Min" and/or "Max" data is missing, the tool may
use "Typ" data in its place. However, the tool should notify
the user of this action.

The circuit_name entry provides the name of the circuit to be
simulated within the referenced file. For SPICE files, this
is normally a ".subckt" name. For VHDL-AMS files, this is
normally an "entity(architecture)" name pair. For Verilog-AMS
files, this is normally a "module" name.

No character limits, case-sensitivity limits or extension
conventions are required or enforced for file_name and
circuit_name entries. However, the total number of characters
in each Corner line must comply with the rules in Section 3.
Furthermore, lower-case file_name entries are recommended to
avoid possible conflicts with file naming conventions under
different operating systems. Case differences between
otherwise identical file_name entries or circuit_name entries
should be avoided. External languages may not support
case-sensitive distinctions.

Parameters:

Lists names of parameters that can be passed into an external
model file. Each Parameters assignment must match a name or
keyword in the external file or language. The list of
Parameters may span several lines by using the word Parameters
at the start of each line. The Parameters subparameter is
optional, and the external model must operate with default
settings without any Parameters assignments.

Parameter passing is not supported in SPICE. VHDL-AMS
parameters are supported using "generic" names, and
Verilog-AMS parameters are supported using "parameter" names.

Ports:

Ports are interfaces to the [External Model] which are
available to the user and tool at the IBIS level. They are
used to connect the [External Model] to die pads. The Ports
parameter is used to identify the ports of the [External
Model] to the simulation tool. The port assignment is by
position and the port names do not have to match exactly the
names inside the external file. The list of port names may
span several lines if the word Ports is used at the start of
each line.

Model units under [External Model] may only use reserved

ports. The reserved, pre-defined port names are listed in the
General Assumptions heading above. As noted earlier, digital
and analog reserved port functions will be assumed by the tool
and connections made accordingly. All the ports appropriate
to the particular Model_type subparameter entry must be
explicitly listed (see below). Note that the user may connect
SPICE models to A_to_D and D_to_A converters using custom
names for analog ports within the model unit, so long as the
digital ports of the converters use the digital reserved port
names.

The rules for pad connections with [External Model] are
identical to those for [Model]. The [Pin Mapping] keyword may
be used with [External Model]s but is not required. If used,
the [External Model] specific voltage supply ports -- A_puref,
A_pdref, A_gcref, A_pcref, and A_extref -- are connected as
defined under the [Pin Mapping] keyword. In all cases, the
voltage levels connected on the reserved supply ports are
defined by the [Power Clamp Reference], [GND Clamp Reference],
[Pullup Reference], [Pulldown Reference], and/or [Voltage
Range] keywords, as in the case of [Model].

Digital-to-Analog/Analog-to-Digital Conversions:

These subparameters define all digital-to-analog and
analog-to-digital converters needed to properly connect
digital signals with the analog ports of referenced external
SPICE models. These subparameters must be used when [External
Model] references a file written in the SPICE language. They
are not permitted with Verilog-AMS or VHDL-AMS external files.

D_to_A:

As assumed in [Model], some interface ports of [External
Model] circuits expect digital input signals. As SPICE models
understand only analog signals, some conversion from digital
to analog format is required. For example, input logical
states such as '0' or '1,' implied in [Model], must be
converted to actual input voltage stimuli, such as a voltage
ramp, for SPICE simulation.

The D_to_A subparameter provides information for converting
a digital stimulus, such as '0' or '1', into an analog voltage
ramp (a digital 'X' input is ignored by D_to_A converters).
Each digital port which carries data for conversion to analog
format must have its own D_to_A line.

The D_to_A subparameter is followed by eight arguments:

    d_port port1 port2 vlow vhigh trise tfall corner_name

The d_port entry holds the name of the digital. This entry is
used for the reserved port names D_drive, D_enable, and
D_switch. The port1 and port2 entries hold the SPICE analog
input port names across which voltages are specified. These
entries are used for the user-defined port names, together

with another port name, used as a reference.

Normally port1 accepts an input signal and port2 is the reference for port1. However, for an opposite polarity stimulus, port1 could be connected to a reference port and port2 could serve as the input.

The vlow and vhigh entries accept analog voltage values which must correspond to the digital off and on states, where the vhigh value must be greater than the vlow value. For example, a 3.3 V ground-referenced buffer would list vlow as 0 V and vhigh as 3.3 V. The trise and tfall entries are times, must be positive and define input ramp rise and fall times between 0 and 100 percent.

The corner_name entry holds the name of the external model corner being referenced, as listed under the Corner subparameter.

At least one D_to_A line must be present, corresponding to the "Typ" corner model, for each digital line to be converted. Additional D_to_A lines for other corners may be omitted. In this case, the typical corner D_to_A entries will apply to all model corners and the "Typ" corner_name entry may be omitted.

A_to_D:

The A_to_D subparameter is used to generate a digital state ('0', '1', or 'X') based on analog voltages generated by the SPICE model or analog voltages present at the pad/pin. This allows an analog signal from the external SPICE circuit or pad/pin to be read as a digital signal by the simulation tool.

The A_to_D subparameter is followed by six arguments:

    d_port port1 port2 vlow vhigh corner_name

The d_port entry lists the reserved port name D_receive. As with D_to_A, the port1 entry would normally contain the reserved name A_signal (see below) or a user-defined port name, while port2 may list any other analog reserved port name, used as a reference. The voltage measurements are taken in this example from the port1 entry with respect to the port2 entry. These ports must also be named by the Ports subparameter.

The vlow and vhigh entries list the low and high analog threshold voltage values. The reported digital state on D_receive will be '0' if the measured voltage is lower than the vlow value, '1' if above the vhigh value, and 'X' otherwise.

The corner_name entry holds the name of the external model corner being referenced, as listed under the Corner subparameter.

At least one A_to_D line must be supplied corresponding to the

"Typ" corner model. Other A_to_D lines for other corners may
be omitted. In this case, the typical corner A_to_D entries
will apply to all model corners.

IMPORTANT: measurements for receivers in IBIS are normally
assumed to be conducted at the die pads/pins. In such cases,
the electrical input model data comprises a "load" which
affects the waveform seen at the pads. However, for models
measure the analog input response at the die pads or inside
the circuit (this does not preclude tools from reporting
digital D_receive and/or analog port responses in addition to
at-pad A_signal response). If at-pad measurements are
desired, the A_signal port would be named in the A_to_D line
under port1. The A_to_D converter then effectively acts "in
parallel" with the load of the circuit. If internal
measurements are desired (e.g., if the user wishes to view the
signal after processing by the receiver), the user-defined
signal port would be named in the A_to_D line under port1. The
A_to_D converter is effectively "in series" with the receiver
model. The vhigh and vlow parameters should be adjusted as
appropriate to the measurement point of interest.

Note that, while the port assignments and SPICE model must
be provided by the user, the D_to_A and A_to_D converters will
be provided automatically by the tool (the converter
parameters must still be declared by the user). There is no
need for the user to develop external SPICE code specifically
for these functions.

A conceptual diagram of the port connections of a SPICE
[External Model] is shown below. The example illustrates an
I/O buffer. Note that the drawing implies that the D_receive
state changes in response to the analog signal my_receive, not
A_signal (see above):

```
                                          +-------------+

```

Figure 7: Example of an [External Model] I/O buffer using SPICE

An example of an [External Model] is shown at the end of
this section.

Pseudo-Differential Buffers:

Pseudo-differential buffers may be described using a pair of
[External Model]s which may or may not be identical. Each of
the analog I/O signal ports (usually A_signal) is connected to
a specific pad through the [Pin] list in the usual fashion,
and the two ports are linked together as a differential pair
through the [Diff Pin] keyword.

The reserved signal name A_signal is required for the I/O
signal ports of [External Model]s connected to pads used in a
pseudo-differential configuration.

Users should note that, in pseudo-differential buffers, only
one formal signal port is used to stimulate the two [External
Model] digital inputs (D_drive). One of these inputs will
reflect the timing and polarity of the formal signal port
named by the user, while the other input is inverted and
(potentially) delayed with respect to the formal port as
defined under the [Diff Pin] keyword. THIS SECOND PORT IS
AUTOMATICALLY CREATED BY THE SIMULATION TOOL. Users do not
have to create special structures to invert or delay the
driven digital signal. Simulation tools will correctly
implement the two input ports once the [Diff Pin] keyword has
been detected in the .ibs file. This approach is identical to
that used in native IBIS.

The D_to_A adapters used for SPICE files can be set up to
control ports on pseudo-differential buffers. If SPICE is
used as an external language, the [Diff Pin] vdiff
subparameter overrides the contents of vlow and vhigh under
A_to_D.

IMPORTANT: For pseudo-differential buffers under [External
Model], the analog input response may only be measured at the
die pads. The [Diff Pin] parameter is required, and controls
both the polarity and the differential thresholds used to
determine the D_receive port response (the D_receive port will
follow the state of the non-inverting pin/pad as referenced
to the inverting pin/pad). For SPICE models, the A_to_D line
must name the A_signal port under either port1 or port2, as
with a single-ended buffer. The A_to_D converter then
effectively acts "in parallel" with the load of the buffer
circuit. The vhigh and vlow parameters will be overriden by
the [Diff Pin] vdiff declarations.

The port relationships are shown in the examples below.

                                                    +---------+
                                                    | /| |--A_puref
                                                    | < |---+ |--A_pcref
                                                    | \| | |--A_gnd
                     +--------+ | | |--A_pdref

Figure 8 - Example SPICE implementation

                 * This signal is automatically created, by inverting and
                    delaying D_drive based on the information in [Diff Pin].

                ** Pseudo-differential buffers must have A_to_D entries,
                    but D_receive is determined by the state of A_signal
                    (Inverting) and A_signal (Non-inverting) according to the
                    [Diff Pin] declaration.

               *** D_enable is shared between the separate buffers. This
                    sharing is handled by the EDA tool.

                 The following drawing illustrates the same concepts with a
                 *-AMS model. Note that the state of D_receive is determined
                 by the tool automatically by observing the A_signal ports.

                                     page 86

The outputs of the actual receiver circuits in the *-AMS
models are not used for determining D_receive.

        (ignored)        +---------+
```

Figure 9 - Example *-AMS implementation

          * This signal is automatically created, by inverting and
            delaying D_drive based on the information in [Diff Pin]
            (digital output will be based on evaluation of signals %%
            and && also using [Diff Pin])

         ** D_receive for pseudo-differential buffers is determined by
            the state of A_signal (Inverting) and A_signal
            (Non-inverting) according to the [Diff Pin] declaration.

        *** D_enable is shared between the separate buffers. This
            sharing is handled by the EDA tool.

        Two additional differential timing test loads are available:

           Rref_diff, Cref_diff

        These subparameters are also available under the [Model Spec]
        keyword for typical, minimum, and maximum corners.

        These timing test loads require both sides of the differential
        model to be operated. They can be used with the existing
        timing test loads Rref, Cref, and Vref. The existing timing
        test loads and Vmeas are used if Rref_diff and Cref_diff are
        NOT given.

        True Differential Models:

        True differential buffers may be described using [External
        Model]. In a true differential [External Model], the
        differential I/O ports which connect to die pads use the

reserved names A_signal_pos and A_signal_neg, as shown in the
diagram below.

```
                +-----------+
  D_enable---|           |---A_puref
             ||\          |---A_pcref
  D_drive----|| \----+---|---A_signal_pos
             || /----|-+-|---A_signal_neg
             ||/ /|  | | |---A_gcref
             | / |--+ | |---A_pdref
  D_receive--|  \ |----+ |
             |   \|     |---A_gnd
             |          |---A_extref
                +-----------+
```

Figure 10

IMPORTANT: All true differential models under [External Model]
assume single-ended digital port connections (D_drive,
D_enable, D_receive).

The [Diff Pin] keyword is still required within the same
[Component] definition when [External Model] describes a true
differential buffer. The models referenced by each pin listed
under [Diff Pin] MUST be the same.

The D_to_A or A_to_D adapters used for SPICE files may be set
up to control or respond to true differential ports. An
example is shown below.

```
            +--------+                      +-----------+
            |        |>--my_enable-->|           |---A_puref
 D_enable -->| D_to_A |               |           |
            |        |---my_ref------|           |---A_pcref
            +--------+                      |           |
                                                ||\         |
            +--------+                      || \----+---+---A_signal_pos
            |        |>--my_drive -->|| /----|-+-+---A_signal_neg
  D_drive -->| D_to_A |               ||/    | | |
            |        |---my_ref------|      | | |
            +--------+                      |      | | |---A_gcref
                                                |      | | |
            +--------+                      |      | | |
            |        |--------------------+ | |
 D_receive -<| A_to_D |               |      | | |
            |        |----------------------+ |
            +--------+                      |      | | |
                                                |  /|  | | |
                                                | / |--+ | |---A_pdref
                                                | \ |----+ |
                                                |  \|      |---A_gnd
                                                |          |---A_extref
                                                +-----------+
```

Figure 11: Example SPICE implementation of a true differential buffer

If at-pad or at-pin measurement using a SPICE [External Model]
is desired, the vlow and vhigh entries under the A_to_D
subparameter must be consistent with the values of the [Diff
Pin] vdiff subparameter entry (the vlow value must match
-vdiff, and the vhigh value must match +vdiff). The logic
states produced by the A_to_D conversion follow the same rules
as for single-ended buffers, listed above. An example is
shown at the end of this section.

IMPORTANT: For true-differential buffers under [External
Model], the user can choose whether to measure the analog
input response at the die pads or internal to the circuit
(this does not preclude tools from reporting digital D_receive
and/or analog responses in addition to at-pad A_signal
response). If at-pad measurements for a SPICE model are
desired, the A_signal_pos port would be named in the A_to_D
line under port1 and A_signal_neg under port2. The A_to_D
converter then effectively acts "in parallel" with the load of
the buffer circuit. If internal measurements are desired
(e.g., if the user wishes to view the signal after processing
by the input buffer), the user-defined analog signal port
would be named in the A_to_D line under port1. The A_to_D
converter is "in series" with the receiver buffer model. The
vhigh and vlow parameters should be adjusted appropriate to
the measurement point of interest, so long as they as they are
consistent with the [Diff Pin] vdiff declarations.

Note that the thresholds refer to the state of the
non-inverting signal, using the inverting signal as a
reference. Therefore, the output signal is considered high
when, for example, the non-inverting input is +200 mV above
the inverting input. Similarly, the output signal is
considered low when the same non-inverting input is -200 mV
"above" the inverting input.

EDA tools will report the state of the D_receive port for true
differential *-AMS [External Model]s according to the AMS code
written by the model author; the use of [Diff Pin] does not
affect the reporting of D_receive in this case. EDA tools are
free to additionally report the state of the I/O pads
according to the [Diff Pin] vdiff subparameter.

For both SPICE and *-AMS true differential [External Model]s,
the EDA tool must not override or change the model author's
connection of the D_receive port.

Four additional Model_type arguments are available under the
[Model] keyword. One of these must be used when an [External
Model] describes a true differential model:

    I/O_diff, Output_diff, 3-state_diff, Input_diff

Two additional differential timing test loads are available:

    Rref_diff, Cref_diff

These subparameters are also available under the [Model Spec]
keyword for the typical, minimum, and maximum corner cases.

These timing test loads require that both the inverting and
non-inverting ports of the differential model refer to valid
buffer model data (not terminations, supply rails, etc.). The
differential test loads may also be combined with the
single-ended timing test loads Rref, Cref, and Vref. Note
that the single-ended timing test loads plus Vmeas are used if
Rref_diff and Cref_diff are NOT supplied.

Series and Series Switch Models:

Native IBIS did not define the transition characteristics of
digital switch controls. Switches were assumed to either be
on or off during a simulation and I-V characteristics could be
defined for either or both states. The [External Model]
format allows users to control the state of a switch through
the D_switch port. As with other digital ports, the use of
SPICE in an [External Model] requires the user to declare
D_to_A ports, to convert the D_switch signal to an analog
input to the SPICE model (whether the port's state may
actually change during a simulation is determined by the EDA
tool used).

Series and Series_switch devices both are described under the
[External Model] keyword using the reserved port names A_pos
and A_neg. Note that the [Series Pin Mapping] keyword must
be present and correctly used elsewhere in the file, in order
to properly set the logic state of the switch. The A_pos port
is defined in the first entry of the [Series Pin Mapping]
keyword, and the A_neg port is defined in the pin2 entry. For
series switches, the [Series Switch Groups] keyword is
required.

Ports required for various Model_types:

As [External Model] makes use of the [Model] keyword's
Model_type subparameter, not all digital and analog reserved
ports may be needed for all Model_types. The table below
defines which reserved port names are required for various
Model_types.

Model_type	D_drive	D_enable	D_receive	A_signal	D_switch	A_pos	A_neg
I/O*	X	X	X	X			
3-state*	X	X		X			
Output*, Open*	X			X			
Input			X	X			
Terminator				X			
Series						X	X
Series_switch					X	X	X

```
| Model_type    D_drive D_enable D_receive A_signal_pos A_signal_neg
|
| I/O_diff        X         X          X         X            X
| 3-state_diff    X         X                    X            X
| Output_diff     X                              X            X
| Input_diff                           X         X            X

|
[End External Model]
|
|===============================================================================
|    Keywords:   [External Circuit], [End External Circuit]
|    Required:   No
| Description:   Used to reference an external file containing an arbitrary
|                circuit description using one of the supported languages.
|  Sub-Params:   Language, Corner, Parameters, Ports, D_to_A, A_to_D
| Usage Rules:   Each [External Circuit] keyword must be followed by a unique
|                name that differs from any name used for any [Model] or
|                [Submodel] keyword.
|
|                The [External Circuit] keyword may appear multiple times.  It
|                is not scoped by any other keyword.
|
|                Each instance of an [External Circuit] is referenced by one or
|                more [Circuit Call] keywords discussed later.  (The [Circuit
|                Call] keyword cannot be used to reference a [Model] keyword.)
|
|                The [External Circuit] keyword and contents may be placed
|                anywhere in the file, outside of any [Component] keyword group
|                or [Model] keyword group, in a manner similar to that of the
|                [Model] keyword.
|
|
|                Subparameter Definitions:
|
|
|                Language:
|
|                Accepts "SPICE", "VHDL-AMS", or "Verilog-AMS" as arguments.
|                The Language subparameter is required and may appear only
|                once.
|
|
|                Corner:
|
|                Three entries follow the Corner subparameter on each line:
|
|                    corner_name file_name circuit_name
|
|                The corner_name entry is "Typ", "Min", or "Max".  The
|                file_name entry points to the referenced file in the same
|                directory as the .ibs file.
|
|                Up to three Corner lines are permitted.  A "Typ" line is
```

required. If "Min" and/or "Max" data is missing, the tool may
use "Typ" data in its place. However, the tool should notify
the user of this action.

The circuit_name entry provides the name of the circuit to be
simulated within the referenced file. For SPICE files, this
is normally a ".subckt" name. For VHDL-AMS files, this is
normally an "entity(architecture)" name pair. For Verilog-AMS
files, this is normally a "module" name.

No character limits, case-sensitivity limits or extension
conventions are required or enforced for file_name and
circuit_name entries. However, the total number of characters
in each Corner line must comply with Section 3. Furthermore,
lower-case file_name entries are recommended to avoid possible
conflicts with file naming conventions under different
operating systems. Case differences between otherwise
identical file_name entries or circuit_name entries should be
avoided. External languages may not support case-sensitive
distinctions.

Parameters:

Lists names of parameters that may be passed into an external
circuit file. Each Parameters assignment must match a name or
keyword in the external file or language. The list of
Parameters can span several lines by using the word Parameters
at the start of each line. The Parameters subparameter is
optional, and the external circuit must operate with default
settings without any Parameters assignments.

Parameter passing is not supported in SPICE. VHDL-AMS
parameters are supported using "generic" names, and
Verilog-AMS parameters are supported using "parameter" names.

Ports:

Ports are interfaces to the [External Model] which are
available to the user and tool at the IBIS level. They are
used to connect the [External Model] to die pads. The Ports
parameter is used to identify the ports of the [External
Model] to the simulation tool. The port assignment is by
position and the port names do not have to match exactly the
names inside the external file. The list of port names may
span several lines if the word Ports is used at the start of
each line.

The Ports parameter is used to identify the ports of the
[External Circuit] to the simulation tool. The port
assignment is by position and the port names do not have to
match exactly the port names in the external file. The list
of port names may span several lines if the word Ports is used
at the start of each line.

[External Circuit] allows any number of ports to be defined,
with any names which comply with Section 3 format

requirements. Reserved port names may be used, but ONLY
DIGITAL PORTS will have the pre-defined functions listed in
the General Assumptions heading above. User-defined and
reserved port names may be combined within the same [External
Circuit].

The [Pin Mapping] keyword cannot be used with [External
Circuit] in the same [Component] description.

Digital-to-Analog/Analog-to-Digital Conversions:

These subparameters define all digital-to-analog and
analog-to-digital converters needed to properly connect
digital signals with the analog ports of referenced external
SPICE models. These subparameters must be used when [External
Circuit] references a file written in the SPICE language.
They are not permitted with Verilog-AMS or VHDL-AMS external
files.

D_to_A:

As assumed in [Model] and [External Model], some interface
ports of [External Circuit]s expect digital input signals. As
SPICE models understand only analog signals, some conversion
from digital to analog format is required. For example, input
logical states such as '0' or '1' must be converted to actual
input voltage stimuli, such as a voltage ramp, for SPICE
simulation.

The D_to_A subparameter provides information for converting a
digital stimulus, such as '0' or '1', into an analog voltage
ramp (a digital 'X' input is ignored by D_to_A converters).
Each digital port which carries data for conversion to analog
format must have its own D_to_A declaration.

The D_to_A subparameter is followed by eight arguments:

    d_port port1 port2 vlow vhigh trise tfall corner_name

The d_port entry holds the name of the digital port. This
entry may contain user-defined port names or the reserved port
names D_drive, D_enable, and D_switch. The port1 and port2
entries hold the SPICE analog input port names across which
voltages are specified. These entries contain user-defined
port names. One of these port entries must name a reference
for the other port (for example, A_gnd).

Normally, port1 accepts an input signal and port2 is the
reference for port1. However, for an opposite polarity
stimulus, port1 could be connected to a voltage reference and
port2 could serve as the input.

The vlow and vhigh entries accept voltage values which
correspond to fully-off and fully-on states, where the vhigh
value must be greater than the vlow value. For example, a
3.3 V ground-referenced buffer would list vlow as 0 V and

vhigh as 3.3 V. The trise and tfall entries are times, must
be positive and define input ramp rise and fall times between
0 and 100 percent.

The corner_name entry holds the name of the external circuit
corner being referenced, as listed under the Corner
subparameter.

Any number of D_to_A subparameter lines is allowed, so long as
each contains a unique port_name entry and at least one unique
port1 or port2 entry (i.e., several D_to_A declarations may
use the same reference node under port1 or port2). At least
one D_to_A line must be present, corresponding to the "Typ"
corner model, for each digital line to be converted.
Additional D_to_A lines for other corners may be omitted. In
this case, the typical corner D_to_A entries will apply to all
model corners and the "Typ" corner_name entry may be omitted.

A_to_D:

The A_to_D subparameter is used to generate a digital state
('0', '1', or 'X') based on analog voltages from the SPICE
model or from the pad/pin. This allows an analog signal from
the external SPICE circuit to be read as a digital signal by
the simulation tool. Each analog port which carries data for
conversion to digital format must have its own A_to_D
declaration line.

The A_to_D subparameter is followed by six arguments:

   d_port port1 port2 vlow vhigh corner_name

The d_port entry lists port names to be used for digital
signals going. As with D_to_A, the port1 entry would contain
a user-defined analog signal. Port2 would list another port
name to be used as a reference. The voltage measurements are
taken from the port1 entry with respect to the port2 entry.
These ports must also be named by the Ports subparameter.

The vlow and vhigh entries list the low and high analog
threshold voltage values. The reported digital state on
D_receive will be '0' if the measured voltage is lower than
the vlow value, '1' if above the vhigh value, and 'X'
otherwise.

The corner_name entry holds the name of the external model
corner being referenced, as listed under the Corner
subparameter.

Any number of A_to_D subparameter lines is allowed, so long
as each contains a unique port_name entry and at least one
unique port1 or port2 entry (i.e., several A_to_D declarations
may use the same reference node under port1 or port2). For
example, a user may wish to create additional A_to_D
converters for individual analog signals to monitor common
mode behaviors on differential buffers (see below).

```
|               At least one A_to_D line must be supplied corresponding to the
|               "Typ" corner model.  Other A_to_D lines for other corners may
|               be omitted.  In this case, the typical corner D_to_A entries
|               will apply to all model corners.
|
|               IMPORTANT: measurements for receivers in IBIS may be conducted
|               at the die pads or the pins.  In such cases, the electrical
|               input model data comprises a "load" which affects the waveform
|               seen.  However, for [External Circuit]s, the user may choose
|               whether to measure the analog input response in the usual
|               fashion or internal to the circuit (this does not preclude
|               tools from reporting digital D_receive and/or analog responses
|               in addition to normal A_signal response).  If native IBIS
|               measurements are desired, the A_signal port would be named in
|               the A_to_D line under port1.  The A_to_D converter then
|               effectively acts "in parallel" with the load of the circuit.
|               If internal measurements are desired (e.g., if the user wishes
|               to view the signal after processing by the receiver), the
|               user-defined analog signal port would be named in the A_to_D
|               line under port1.  The A_to_D converter is effectively
|               "in series" with the receiver model.  The vhigh and vlow
|               parameters should be adjusted appropriate to the measurement
|               point of interest.
|
|               Note that, while the port assignments and SPICE model data
|               must be provided by the user, the D_to_A and A_to_D converters
|               will be provided automatically by the tool.  There is no need
|               for the user to develop external SPICE code specifically for
|               these functions.
|
|               The [Diff Pin] keyword is NOT required for true differential
|               [External Circuit] descriptions.
|
|               Pseudo-differential buffers are not supported under [External
|               Circuit].  Use the existing [Model] and [External Model]
|               keywords to describe these structures.
|
|               Note that the EDA tool is responsible for determining the
|               specific measurement points for reporting timing and signal
|               quality for [External Circuit]s.
|
|               In all other respects, [External Circuit] behaves exactly as
|               [External Model].

[End External Circuit]
|
|==============================================================================
|
The scope of the following keywords is limited to the [Component] keyword.
They apply to the specific set of pin numbers and internal nodes only within
that [Component].
|
|==============================================================================
|     Keywords:   [Node Declarations], [End Node Declarations]
|     Required:   Yes, if any internal nodes exist on the die as listed in
|                 [Circuit Call], and/or if any die pads need to be explicitly
|                 defined.
| Description:    Provides a list of internal die nodes and/or die pads for a
|                 [Component] to make unambiguous interconnection descriptions
|                 possible.
| Usage Rules:    All die node and die pad names that appear under any [Circuit
|                 Call] keyword within the same [Component] must be listed under
|                 the [Node Declarations] keyword.
|
|                 If used, the [Node Declarations] keyword must appear before
|                 any [Circuit Call] keyword(s) under the [Component] keyword.
|                 Only one [Node Declarations] keyword is permitted for each
|                 [Component] keyword.  Since the [Node Declarations] keyword
|                 is part of the [Component] keyword, all internal node or pad
|                 references apply only to that [Component] (i.e., they are
|                 local).
|
|                 The internal die node and/or die pad names within [Node
|                 Declarations] must be unique and therefore different from
|                 the pin names used in the [Pin] keyword.  Each node and/or
|                 pad name must be separated by at least one white space.  The
|                 list may span several lines and is terminated by the [End
|                 Node Declarations] keyword.
|
|                 The names of die nodes and die pads can be composed of any
|                 combination of the legal characters outlined in Section 3.
|------------------------------------------------------------------------------
```

```
[Node Declarations]              | Must appear before any [Circuit Call] keyword
|
| Die nodes:
a b c d e                        | List of die nodes
f g h nd1
|
| Die pads:
pad_2a pad_2b pad_4 pad_11   | List of die pads
|
[End Node Declarations]
|
|===============================================================================
|     Keywords:  [Circuit Call], [End Circuit Call]
|     Required:  Yes, if any [External Circuit]s are present in a [Component].
| Description:  This keyword is used to instantiate [External Circuit]s and
|               to connect their ports to the die nodes or die pads.
|  Sub-Params:  Signal_pin, Diff_signal_pins, Series_pins, Port_map
| Usage Rules:  The [Circuit Call] keyword must be followed by the name of
|               an [External Circuit] that exists in the same [Component].
|
|               When a [Circuit Call] keyword defines any connections that
|               involve one or more die pads (and consequently pins), the
|               corresponding pins on the [Pin] list must use the reserved
|               word "CIRCUITCALL" in the third column instead of a model
|               name.
|
|               Each [External Circuit] must have at least one corresponding
|               [Circuit Call] keyword.  Multiple [Circuit Call] keywords may
|               appear under a [Component] using the same [External Circuit]
|               name, if multiple instantiations of an [External Circuit] are
|               needed.
|
|
|               Signal_pin, Diff_signal_pins, or Series_pins:
|
|               The purpose of these subparameters is to identify which
|               [External Circuit] needs to be stimulated in order to obtain
|               a signal on a certain pin.  These subparameters must be used
|               only when the [External Circuit] that is referenced by the
|               [Circuit Call] keyword has an effect on a pin.  Only one of
|               the three subparameters is permitted in a given [Circuit Call]
|               keyword.  The subparameters are followed by one or two pin
|               names which are defined by the [Pin] keyword.
|
|               Signal_pin is used when the referenced [External Circuit] has
|               a single analog signal port (I/O) connection to one pin.  The
|               subparameter is followed by a pin name that must match one of
|               the pin names under the [Pin] keyword.
|
|               Diff_signal_pins is used when the referenced [External
|               Circuit] describes a true differential model which has two
|               analog signal port (I/O) connections, each to a separate pin.
|               The subparameter is followed by two pin names, each of which
|               must match one of the pin names under the [Pin] keyword.  The
|               first and second pin names correspond to the non-inverting and
|               inverting signals of the differential model, respectively.
|               The two pin names must not be identical.
|
```

Series_pins is used when the referenced [External Circuit]
describes a Series or Series_switch model which has two analog
signal port (I/O) connections to two pins. The subparameter
is followed by two pin names, each of which must match one of
the pin names under the [Pin] keyword. The first and second
pin names correspond to the positive and negative ports of the
Series or Series_switch model, respectively. However, the
polarity order matters only when the model is polarity
sensitive (as with the [Series Current] keyword). The two pin
names must not be identical.

Port_map:

The Port_map subparameter is used to connect the ports of an
[External Circuit] to die nodes or die pads.

Every occurrence of the Port_map subparameter must begin on a
new line and must be followed by two arguments, the first
being a port name, and the second being a die node, die pad,
or a pin name.

The first argument of Port_map must contain a port name that
matches one of the port names in the corresponding [External
Circuit] definition. No port name may be listed more than
once within a [Circuit Call] statement. Only those port names
need to be listed with the Port_map subparameter which are
connected to a die node or a die pad. This includes reserved
and/or user-defined port names.

The second argument of the Port_map subparameter contains
the name of a die node, die pad, or a pin. The names of die
nodes, die pads, and pins may appear multiple times as
Port_map subparameter arguments within the same [Circuit
Call] statement to signify a common connection between
multiple ports, such as common voltage supply.

Please note that a pin name in the second argument does not
mean that the connection is made directly to the pin. Since
native IBIS does not have a mechanism to declare die pads
explicitly, connections to die pads are made through their
corresponding pin names (listed under the [Pin] keyword).
This convention must only be used with native IBIS package
models where a one-to-one path between the die pads and pins
is assumed. When a package model other than native IBIS is
used with a [Component], the second argument of Port_map must
have a die pad or die node name. These names are matched to
the corresponding port name of the non-native package model by
name (not by position). In this case, the package model may
have an arbitrary circuit topology between the die pads and
the pins. A one-to-one mapping is not required.

Examples:

For the examples below please refer to the following diagram and the
example provided for the [Node Declarations] keyword.

```

|===============================================================================
|
| The [Package Model] keyword is optional.  If more than the default RLC
| package model is desired, use the [Define Package Model] keyword.
|
| Use the [Package Model] keyword within a [Component] to indicate the package
| model for that component.  The specification permits .ibs files to contain
| the following additional list of package model keywords.  Note that the
| actual package models can be in a separate <package_file_name>.pkg file or
| can exist in the IBIS files between the [Define Package Model] ...
| [End Package Model] keywords for each package model that is defined.  For
| reference, these keywords are listed below.  Full descriptions follow.   EDA
| tools that do not support these keywords will ignore all entries between the
| [Define Package Model] and [End Package Model] keywords.
|
|    [Define Package Model]       Required if the [Package Model] keyword is used
|    [Manufacturer]               (note 1)
|    [OEM]                        (note 1)
|    [Description]                (note 1)
|    [Number Of Sections]         (note 2)
|    [Number Of Pins]             (note 1)
|    [Pin Numbers]                (note 1)
|    [Model Data]                 (note 2)
|    [Resistance Matrix]          Optional when [Model Data] is used
|    [Inductance Matrix]          (note 3)
|    [Capacitance Matrix]         (note 3)
|    [Bandwidth]                  Required (for Banded_matrix matrices only)
|    [Row]                        (note 3)
|    [End Model Data]             (note 2)
|    [End Package Model]          (note 1)
|
| (note 1) Required when the [Define Package Model] keyword is used
| (note 2) Either the [Number Of Sections] or the [Model Data]/[End Model
|          Data] keywords are required.  Note that [Number of Sections] and
|          the [Model Data]/[End Model Data] keywords are mutually exclusive.
| (note 3) Required when the [Define Package Model] keyword is used
|          and the [Number Of Sections] keyword is not used.
|
| When package model definitions occur within a .ibs file, their scope is
| "local" -- they are known only within that .ibs file and no other.  In
| addition, within that .ibs file, they override any globally defined package
| models that have the same name.
|
| USAGE RULES FOR THE .PKG FILE:
|
| Package models are stored in a file whose name looks like:
|
|    <filename>.pkg.
|
| The <filename> provided must adhere to the rules given in Section 3, GENERAL
```

```
| SYNTAX RULES AND GUIDELINES.  Use the ".pkg" extension to identify files
| containing package models.  The .pkg file must contain all of the required
| elements of a normal .ibs file, including [IBIS Ver], [File Name], [File
| Rev], and the [End] keywords.  Optional elements include the [Date],
| [Source], [Notes], [Disclaimer], [Copyright], and [Comment Char] keywords.
| All of the elements follow the same rules as those for a normal .ibs file.
|
| Note that the [Component] and [Model] keywords are not allowed in the .pkg
| file.  The .pkg file is for package models only.
|
|================================================================================
|      Keyword:   [Define Package Model]
|     Required:   Yes
| Description:   Marks the beginning of a package model description.
| Usage Rules:   If the .pkg file contains data for more than one package, each
|                section must begin with a new [Define Package Model] keyword.
|                The length of the package model name must not exceed 40
|                characters in length.  Blank characters are allowed.  For
|                every package model name defined under the [Package Model]
|                keyword, there must be a matching [Define Package Model]
|                keyword.
|--------------------------------------------------------------------------------
[Define Package Model]     QS-SMT-cer-8-pin-pkgs
|
|================================================================================
|      Keyword:   [Manufacturer]
|     Required:   Yes
| Description:   Declares the manufacturer of the component(s) that use this
|                package model.
| Usage Rules:   The length of the manufacturer's name must not exceed 40
|                characters (blank characters are allowed, e.g., Texas
|                Instruments).  In addition, each manufacturer must use a
|                consistent name in all .ibs and .pkg files.
|--------------------------------------------------------------------------------
[Manufacturer]   Quality Semiconductors Ltd.
|
|================================================================================
|      Keyword:   [OEM]
|     Required:   Yes
| Description:   Declares the manufacturer of the package.
| Usage Rules:   The length of the manufacturer's name must not exceed 40
|                characters (blank characters are allowed).  In addition, each
|                manufacturer must use a consistent name in all .ibs and .pkg
|                files.
| Other Notes:   This keyword is useful if the semiconductor vendor sells a
|                single IC in packages from different manufacturers.
|--------------------------------------------------------------------------------
[OEM]            Acme Packaging Co.
|
|================================================================================
|      Keyword:   [Description]
|     Required:   Yes
| Description:   Provides a concise yet easily human-readable description of
|                what kind of package the [Package Model] is representing.
| Usage Rules:   The description must be less than 60 characters in length,
|                must fit on a single line, and may contain spaces.
|--------------------------------------------------------------------------------
[Description]    220-Pin Quad Ceramic Flat Pack
```

```
|
|===============================================================================
|     Keyword:    [Number Of Sections]
|    Required:    No
| Description:    Defines the maximum number of sections that make up a 'package
|                 stub'.  A package stub is defined as the connection between
|                 the die pad and the corresponding package pin; it can include
|                 (but is not limited to) the bondwire, the connection between
|                 the bondwire and pin, and the pin itself.  This keyword must
|                 be used if a modeler wishes to describe any package stub as
|                 other than a single, lumped L/R/C.  The sections of a package
|                 stub are assumed to connect to each other in a series fashion.
| Usage Rules:    The argument is a positive integer greater than zero.  This
|                 keyword, if used, must appear in the specification before the
|                 [Pin Numbers] keyword.  The maximum number of sections
|                 includes sections between the Fork and Endfork subparameters.
|-------------------------------------------------------------------------------
[Number Of Sections] 3
|
|
|===============================================================================
|     Keyword:    [Number Of Pins]
|    Required:    Yes
| Description:    Tells the parser how many pins to expect.
| Usage Rules:    The field must be a positive decimal integer.  The [Number
|                 Of Pins] keyword must be positioned before the [Pin Numbers]
|                 keyword.
|-------------------------------------------------------------------------------
[Number Of Pins]    128
|
|
|===============================================================================
|     Keyword:    [Pin Numbers]
|    Required:    Yes
| Description:    Tells the parser the set of names that are used for the
|                 package pins and also defines pin ordering.  If the [Number Of
|                 Sections] keyword is present it also lists the elements for
|                 each section of a pin's die to pin connection.
|  Sub-Params:    Len, L, R, C, Fork, Endfork
| Usage Rules:    Following the [Pin Numbers] keyword, the names of the pins are
|                 listed.  There must be as many names listed as there are pins
|                 (as given by the preceding [Number Of Pins] keyword).  Pin
|                 names can not exceed 5 characters in length.  The first pin
|                 name given is the "lowest" pin, and the last pin given is the
|                 "highest."  If the [Number Of Sections] keyword is used then
|                 each pin name must be followed by one or more of the legal
|                 subparameter combinations listed below.  If the [Number Of
|                 Sections] keyword is not present then subparameter usage is
|                 NOT allowed.
|
|
|                 Subparameters:
|
|                 The Len, L, R, and C subparameters specify the length,
|                 inductance, capacitance and resistance of each section of each
|                 stub on a package.
|
|                 The Fork and Endfork subparameters are used to denote branches
|                 from the main package stub.
|
|                 Len     The length of a package stub section.  Lengths are
```

```
|                   given in terms of arbitrary 'units'.
|         L         The inductance of a package stub section, in terms of
|                   'inductance/unit length'.  For example, if the total
|                   inductance of a section is 3.0nH and the length of the
|                   section is 2 'units', the inductance would be listed
|                   as L = 1.5nH  (i.e. 3.0 / 2).
|         C         The capacitance of a package stub section, in terms of
|                   capacitance per unit length.
|         R         The DC (ohmic) resistance of a package stub section,
|                   in terms of ohms per unit length.
|         Fork      This subparameter indicates that the sections
|                   following (up to the Endfork subparameter) are part of
|                   a branch off of the main package stub.  This
|                   subparameter has no arguments.
|         Endfork   This subparameter indicates the end point of a branch.
|                   For every Fork subparameter there must be a
|                   corresponding Endfork subparameter.  As with the Fork
|                   subparameter, the Endfork subparameter has no
|                   arguments.
|
|         Specifying a Len or L/R/C value of zero is allowed.  If
|         Len = 0 is specified, then the L/R/C values are the total for
|         that section.  If a non-zero length is specified, then the
|         total L/R/C for a section is calculated by multiplying the
|         value of the Len subparameter by the value of the L, R, or C
|         subparameter.  However, if a non-zero length section is
|         specified, the L and C for that section should be treated as
|         distributed elements.
|
|         Using The Subparameters to Describe Package Stub Sections:
|
|         A section description begins with the Len subparameter and
|         ends with the slash (/) character.  The value of the Len, L,
|         R, and C subparameters and the subparameter itself are
|         separated by an equals sign (=); white space around the equals
|         sign is optional.  The Fork and Endfork subparameters are
|         placed between section descriptions (i.e., between the
|         concluding slash of one section and the 'Len' parameter that
|         starts another).  A particular section description can contain
|         no data (i.e., the description is given as 'Len = 0 /').
|
|         Legal Subparameter Combinations for Section Descriptions:
|
|         A)  A single Len = 0 subparameter, followed by a slash.  This
|         is used to describe a section with no data.
|
|         B)  Len, and one or more of the L, R and C subparameters.  If
|         the Len subparameter is given as zero, then the L/R/C
|         subparameters represent lumped elements.  If the Len
|         subparameter is non-zero, then the L/R/C subparameters
|         represent distributed elements.
|
|         C)  Single Fork or Endfork subparameter.  Normally, a package
|         stub is described as several sections, with the Fork and
|         Endfork subparameters surrounding a group of sections in the
|         middle of the complete package stub description.  However, it
|         is legal for the Fork/Endfork subparameters to appear at the
|         end of a section description.  The package pin is connected to
```

| the last section of a package stub description not surrounded
| by a Fork/Endfork statements. See the examples below.
|
| Package Stub Boundaries:
|
| A package stub description starts at the connection to the die
| and ends at the point at which the package pin interfaces with
| the board or substrate the IC package is mounted on. Note
| that in the case of a component with through-hole pins, the
| package stub description should include only the portion of
| the pin not physically inserted into the board or socket.
| However, it is legal for a package stub description to include
| both the component and socket together if this is how the
| component is intended to be used.
|---
| A three-section package stub description that includes a bond wire (lumped
| inductance), a trace (treated as a transmission line with DC resistance),
| and a pin modeled as a lumped L/C element.
|
[Pin Numbers]
A1 Len=0 L=1.2n/ Len=1.2 L=2.0n C=0.5p R=0.05/ Len=0 L=2.0n C=1.0p/
|
| Pin A2 below has a section with no data
|
A2 Len=0 L=1.2n/ Len=0/ Len=1.2 L=2.0n C=0.5p R=0.05/ Len=0 L=2.0n C=1.0p/
|
| A section description using the Fork and Endfork subparameters. Note that
| the indentation of the Fork and Endfork subparameters are for readability
| are not required.
|
A1 Len=0 L=2.3n / | bondwire
Len=1.2 L=1.0n C=2.5p / | first section
 Fork | indicates the starting of a branch
 Len=1.0 L=2.0n C=1.5p / | section
 Endfork | ending of the branch
Len=0.5 L=1.0 C=2.5p/ | second section
Len=0.0 L=1.5n / | pin
|
| Here is an example where the Fork/Endfork subparameters are at the end of a
| package stub description.
|
B13 Len=0 L=2.3n / | bondwire
Len=1.2 L=1.0n C=2.5p / | first section
Len=0.5 L=1.0 C=2.5/ | second section, pin connects here
Fork | indicates the starting of a branch
Len=1.0 L=2.0n C=1.5p / | section
Endfork | ending of the branch
|
|===
| **Keyword: [Model Data]**
| Required: Yes
| Description: Indicates the beginning of the formatted package model data,
| that can include the [Resistance Matrix], [Inductance Matrix],
| [Capacitance Matrix], [Bandwidth], and [Row] keywords.
|---
[Model Data]
|
|
|===

```
|      Keyword:   [End Model Data]
|     Required:   Yes
| Description:    Indicates the end of the formatted model data.
| Other Notes:    In between the [Model Data] and [End Model Data] keywords is
|                 the package model data itself.  The data is a set of three
|                 matrices: the resistance (R), inductance (L), and capacitance
|                 (C) matrices.  Each matrix can be formatted differently (see
|                 below).  Use one of the matrix keywords below to mark the
|                 beginning of each new matrix.
|-------------------------------------------------------------------------------
[End Model Data]
|
|
|===============================================================================
|     Keywords:   [Resistance Matrix], [Inductance Matrix], [Capacitance Matrix]
|     Required:   [Resistance Matrix] is optional.  If it is not present, its
|                 entries are assumed to be zero.  [Inductance Matrix] and
|                 [Capacitance Matrix] are required.
|   Sub-Params:   Banded_matrix, Sparse_matrix, or Full_matrix
| Description:    The subparameters mark the beginning of a matrix, and specify
|                 how the matrix data is formatted.
| Usage Rules:    For each matrix keyword, use only one of the subparameters.
|                 After each of these subparameters, insert the matrix data in
|                 the appropriate format.  (These formats are described in
|                 detail below.)
| Other Notes:    The resistance, inductance, and capacitance matrices are also
|                 referred to as "RLC matrices" within this specification.
|
|                 When measuring the entries of the RLC matrices, either with
|                 laboratory equipment or field-solver software, currents are
|                 defined as ENTERING the pins of the package from the board
|                 (General Syntax Rule #11).  The corresponding voltage drops
|                 are to be measured with the current pointing "in" to the "+"
|                 sign and "out" of the "-" sign.
|
|                            I1    +-----+     I2
|                           -----> |     | <------
|                  board o--------| Pkg |---------o board
|                          +  V1 - |     | -  V2   +
|                                  +-----+
|
|                 It is important to observe this convention in order to get the
|                 correct signs for the mutual inductances and resistances.
|-------------------------------------------------------------------------------
[Resistance Matrix]      Banded_matrix
[Inductance Matrix]      Sparse_matrix
[Capacitance Matrix]     Full_matrix
|
|===============================================================================
|
| RLC MATRIX NOTES:
|
| For each [Resistance Matrix], [Inductance Matrix], or [Capacitance Matrix]
| a different format can be used for the data.  The choice of formats is
| provided to satisfy different simulation accuracy and speed requirements.
| Also, there are many packages in which the resistance matrix can have no
| coupling terms at all.  In this case, the most concise format
| (Banded_matrix) can be used.
|
```

| There are two different ways to extract the coefficients that are reported
| in the capacitance and inductance matrices. For the purposes of this
| specification, the coefficients reported in the capacitance matrices shall
| be the 'electrostatic induction coefficients' or 'Maxwell's capacitances'.
| The Maxwell capacitance Kij is defined as the charge induced on conductor
| "j" when conductor "i" is held at 1 volt and all other conductors are held
| at zero volts. Note that Kij (when i /= j) will be a negative number and
| should be entered as such. Likewise, for the inductance matrix the
| coefficients for Lij are defined as the voltage induced on conductor "j"
| when conductor "i"'s current is changed by 1amp/sec and all other conductors
| have no current change.
|
| One common aspect of all the different formats is that they exploit the
| symmetry of the matrices they describe. This means that the entries below
| the main diagonal of the matrix are identical to the corresponding entries
| above the main diagonal. Therefore, only roughly one-half of the matrix
| needs to be described. By convention, the main diagonal and the UPPER half
| of the matrix are provided.
|
| In the following text, we use the notation [I, J] to refer to the entry in
| row I and column J of the matrix. Note that I and J are allowed to be
| alphanumeric strings as well as integers. An ordering of these strings is
| defined in the [Pin Numbers] section. In the following text, "Row 1" means
| the row corresponding to the first pin.
|
| Also note that the numeric entries of the RLC matrices are standard IBIS
| floating point numbers. As such, it is permissible to use metric "suffix"
| notation. Thus, an entry of the C matrix could be given as 1.23e-12 or as
| 1.23p or 1.23pF.
|
| Full_matrix:
|
| When the Full_matrix format is used, the couplings between every pair of
| elements is specified explicitly. Assume that the matrix has N rows and N
| columns. The Full_matrix is specified one row at a time, starting with
| Row 1 and continuing down to Row N.
|
| Each new row is identified with the Row keyword.
|
|===
| Keyword: [Row]
| Required: Yes
| Description: Indicates the beginning of a new row of the matrix.
| Usage Rules: The argument must be one of the pin names listed under the
| [Pin Numbers] keyword.
|---
[Row]   3
|
|===
| Following a [Row] keyword is a block of numbers that represent the entries
| for that row. Suppose that the current row is number M. Then the first
| number listed is the diagonal entry, [M,M]. Following this number are the
| entries of the upper half of the matrix that belong to row M: [M, M+1],
| [M, M+2], ... up to [M,N].
|
| For even a modest-sized package, this data will not all fit on one line.
| You can break the data up with new-line characters so that the 80 character
| line length limit is observed.

|
| An example: suppose the package has 40 pins and that we are currently
| working on Row 19. There is 1 diagonal entry, plus 40 - 19 = 21 entries in
| the upper half of the matrix to be specified, for 22 entries total. The
| data might be formatted as follows:
|
[Row]   19
5.67e-9 1.1e-9 0.8e-9 0.6e-9 0.4e-9 0.2e-9   0.1e-9   0.09e-9
8e-10   7e-10   6e-10   5e-10   4e-10   3e-10   2e-10   1e-10
9e-11   8e-11   7e-11   6e-11   5e-11   4e-11
|
| In the above example, the entry 5.67e-9 is on the diagonal of row 19.
|
| Observe that Row 1 always has the most entries, and that each successive row
| has one fewer entry than the last; the last row always has just a single
| entry.
|
| Banded_matrix:
|
| A Banded_matrix is one whose entries are guaranteed to be zero if they are
| farther away from the main diagonal than a certain distance, known as the
| "bandwidth." Let the matrix size be N x M, and let the bandwidth be B.
| An entry [I,J] of the matrix is zero if:
|
| | I - J | > B
|
| where |.| denotes the absolute value.
|
| The Banded_matrix is used to specify the coupling effects up to B pins on
| either side. Two variations are supported. One allows for the coupling to
| circle back on itself. This is technically a simple form of a bordered
| block diagonal matrix. However, its data can be completely specified in
| terms of a Banded_matrix for an N x M matrix consisting of N rows and
| M = N + B columns. The second variation is just in terms of an N x N matrix
| where no circle back coupling needs to be specified.
|
| The bandwidth for a Banded_matrix must be specified using the [Bandwidth]
| keyword:
|
|==
| **Keyword: [Bandwidth]**
| Required: Yes (for Banded_matrix matrices only)
| Description: Indicates the bandwidth of the matrix.
| Usage Rules: The bandwidth field must be a non-negative integer. This
| keyword must occur after the [Resistance Matrix], etc.,
| keywords, and before the matrix data is given.
|--
[Bandwidth]   10
|
|==
| Specify the banded matrix one row at a time, starting with row 1 and working
| up to higher rows. Mark each row with the [Row] keyword, as above. As
| before, symmetry is exploited: do not provide entries below the main
| diagonal.
|
| For the case where coupling can circle back on itself, consider a matrix of
| N pins organized into N rows 1 ... N and M columns 1 ... N, 1 ... B. The
| first row only needs to specify the entries [1,1] through [1,1+B] since all

page 115

| other entries are guaranteed to be zero. The second row will need to
| specify the entries [2,2] through [2,2+B], and so on. For row K the
| entries [K,K] through [K,K+B] are given when K + B is less than or equal to
| the size of the matrix N. When K + B exceeds N, the entries in the last
| columns 1 ... B specify the coupling to the first rows. For row K, the
| entries [K,K] ... [K,N] [K,1] ... [K,R] are given where R =
| mod(K + B - 1, N) + 1. All rows will contain B + 1 entries. To avoid
| redundant entries, the bandwidth is limited to B <= int((N - 1) / 2).
|
| For the case where coupling does not circle back on itself, the process is
| modified. Only N columns need to be considered. When K + B finally exceeds
| the size of the matrix N, the number of entries in each row starts to
| decrease; the last row (row N) has only 1 entry. This construction
| constrains the bandwidth to B < N.
|
| As in the Full_matrix, if all the entries for a particular row do not fit
| into a single 80-character line, the entries can be broken across several
| lines.
|
| It is possible to use a bandwidth of 0 to specify a diagonal matrix (a
| matrix with no coupling terms.) This is sometimes useful for resistance
| matrices.
|
| Sparse_matrix:
|
| A Sparse_matrix is expected to consist mostly of zero-valued entries, except
| for a few nonzeros. Unlike the Banded_matrix, there is no restriction on
| where the nonzero entries can occur. This feature is useful in certain
| situations, such as for Pin Grid Arrays (PGAs).
|
| As usual, symmetry can be exploited to reduce the amount of data by
| eliminating from the matrix any entries below the main diagonal.
|
| An N x N Sparse_matrix is specified one row at a time, starting with row 1
| and continuing down to row N. Each new row is marked with the [Row]
| keyword, as in the other matrix formats.
|
| Data for the entries of a row is given in a slightly different format,
| however. For the entry [I, J] of a row, it is necessary to explicitly list
| the name of pin J before the value of the entry is given. This
| specification serves to indicate to the parser where the entry is put into
| the matrix.
|
| The proper location is not otherwise obvious because of the lack of
| restrictions on where nonzeros can occur. Each (Index, Value) pair is
| listed upon a separate line. An example follows. Suppose that row 10 has
| nonzero entries [10,10], [10,11], [10,15], and [10,25]. The following row
| data would be provided:
|
[Row]   10
| Index   Value
10   5.7e-9
11   1.1e-9
15   1.1e-9
25   1.1e-9
|
| Note that each of the column indices listed for any row must be greater than
| or equal to the row index, because they always come from the upper half of

| the matrix. When alphanumeric pin names are used, special care must be
| taken to ensure that the ordering defined in the [Pin Numbers] section is
| observed.
|
| With this convention, please note that the Nth row of an N x N matrix has
| just a single entry (the diagonal entry).
|
|===
| **Keyword: [End Package Model]**
| Required: Yes
| Description: Marks the end of a package model description.
| Usage Rules: This keyword must come at the end of each complete package
| model description.
|
| Optionally, add a comment after the [End Package Model]
| keyword to clarify which package model has just ended. For
| example,
|
| [Define Package Model]   My_Model
| |
| | ... content of model ...
| |
| [End Package Model] | end of My_Model
|---
[End Package Model]
|
|===
| Package Model Example
|
| The following is an example of a package model file following the
| package modeling specifications. For the sake of brevity, an 8-pin package
| has been described. For purposes of illustration, each of the matrices is
| specified using a different format.
|
|===
|
[IBIS Ver]   4.1
[File Name]   example.pkg
[File Rev]   0.1

|================================================================================
|================================================================================
|
| A "board level component" is the generic term to be used to describe a
| printed circuit board (PCB) or substrate which can contain components or
| even other boards, and which can connect to another board through a set of
| user visible pins.  The electrical connectivity of such a board level
| component is referred to as an "Electrical Board Description".  For example,
| a SIMM module is a board level component that is used to attach several DRAM
| components on the PCB to another board through edge connector pins.  An
| electrical board description file (a .ebd file) is defined to describe the
| connections of a board level component between the board pins and its
| components on the board.
|
| A fundamental assumption regarding the electrical board description is that
| the inductance and capacitance parameters listed in the file are derived
| with respect to well-defined reference plane(s) within the board.  Also,
| this current description does not allow one to describe electrical
| (inductive or capacitive) coupling between paths.  It is recommended that if
| coupling is an issue, then an electrical description be extracted from the
| physical parameters of the board.
|
| What is, and is not, included in an Electrical Board Description is defined
| by its boundaries.  For the definition of the boundaries, see the
| Description section under the [Path Description] Keyword.
|
| USAGE RULES:
|
| A .ebd file is intended to be a stand-alone file, not associated with any
| .ibs file.  Electrical Board Descriptions are stored in a file whose name
| looks like <filename>.ebd, where <filename> must conform to the naming rules
| given in the General Syntax Section of this specification.  The .ebd
| extension is mandatory.
|
| CONTENTS:
|
| A .ebd file is structured similar to a standard IBIS file.  It must contain
| the following keywords, as defined in the IBIS specification: [IBIS Ver],
| [File Name], [File Rev], and [End].  It may also contain the following
| optional keywords: [Comment Char], [Date], [Source], [Notes], [Disclaimer],
| and [Copyright].  The actual board description is contained between the
| keywords [Begin Board Description] and [End Board Description], and includes
| the keywords listed below:
|
|    [Begin Board Description]
|    [Manufacturer]
|    [Number Of Pins]
|    [Pin List]
|    [Path Description]
|    [Reference Designator Map]
|    [End Board Description]
```

|
| More than one [Begin Board Description]/[End Board Description] keyword pair
| is allowed in a .ebd file.
|
|
|===
| Keyword: **[Begin Board Description]**
| Required: Yes
| Description: Marks the beginning of an Electrical Board Description.
| Usage Rules: The keyword is followed by the name of the board level
| component. If the .ebd file contains more than one [Begin
| Board Description] keyword, then each name must be unique.
| The length of the component name must not exceed 40 characters
| in length, and blank characters are allowed. For every
| [Begin Board Description] keyword there must be a matching
| [End Board Description] keyword.
|---
[Begin Board Description] 16Meg X 8 SIMM Module
|
|
|===
| Keyword: **[Manufacturer]**
| Required: Yes
| Description: Declares the manufacturer of the components(s) that use this
| .ebd file.
| Usage Rules: Following the keyword is the manufacturer's name. It must not
| exceed 40 characters, and can include blank characters. Each
| manufacturer must use a consistent name in all .ebd files.
|---
[Manufacturer] Quality SIMM Corp.
|
|
|===
| Keyword: **[Number Of Pins]**
| Required: Yes
| Description: Tells the parser the number of pins to expect. Pins are any
| externally accessible electrical connection to the component.
| Usage Rules: The field must be a positive decimal integer. Note: The
| simulator must not limit the Number Of Pins to any value less
| than 1,000. The [Number Of Pins] keyword must be positioned
| before the [Pin List] keyword.
|---
[Number Of Pins] 128
|
|
|===
| Keyword: **[Pin List]**
| Required: Yes
| Description: Tells the parser the pin names of the user accessible pins.
| It also informs the parser which pins are connected to power
| and ground.
| Sub-Params: signal_name
| Usage Rules: Following the [Pin List] keyword are two columns. The first
| column lists the pin name while the second lists the data book
| name of the signal connected to that pin. There must be as
| many pin_name/signal_name rows as there are pins given by the
| preceding [Number Of Pins] keyword. Pin names must be the
| alphanumeric external pin names of the part. The pin names
| cannot exceed eight characters in length. Any pin associated
| with a signal name that begins with "GND" or "POWER" will be
| interpreted as connecting to the boards ground or power plane.
| In addition, NC is a legal signal name and indicates that the

```
|                   Pin is a 'no connect'.  As per the IBIS standard "GND",
|                   "POWER" and "NC" are case insensitive.
|-------------------------------------------------------------------------------
|   A SIMM Board Example:
|
[Pin List]  signal_name
 A1          GND
 A2          data1
 A3          data2
 A4          POWER5     | This pin connects to 5 V
 A5          NC         | a no connect pin
|  .
|  .
 A22         POWER3.3   | This pin connects to 3.3 V
 B1          casa
|  .
|  .
|etc.
|
|===============================================================================
|      Keyword:   [Path Description]
|     Required:  Yes
|  Description:  This keyword allows the user to describe the connection
|                   between the user accessible pins of a board level component
|                   and other pins or pins of the ICs mounted on that board.  Each
|                   pin to node connection is divided into one or more cascaded
|                   "sections", where each section is described in terms of its
|                   L/R/C per unit length.  The Fork and Endfork subparameters
|                   allow the path to branch to multiple nodes, or another pin.  A
|                   path description is required for each pin whose signal name is
|                   not "GND", "POWER" or "NC".
|
|                   Board Description and IC Boundaries:
|
|                   In any system, each board level component interfaces with
|                   another board level component at some boundary.  Every
|                   electrical board description must contain the components
|                   necessary to represent the behavior of the board level
|                   component being described within its boundaries. The boundary
|                   definition depends upon the board level component being
|                   described.
|
|                   For CARD EDGE CONNECTIONS such as a SIMM or a PC Daughter Card
|                   plugged into a SIMM Socket or Edge Connector, the boundary
|                   should be at the end of the board card edge pads as they
|                   emerge from the connector.
|
|                   For any THROUGH-HOLE MOUNTED COMPONENT, the boundary will be
|                   at the surface of the board on which the component is mounted.
|
|                   SURFACE MOUNTED COMPONENT models end at the outboard end of
|                   their recommended surface mount pads.
|
|                   If the board level component contains an UNMATED CONNECTOR,
|                   the unmated connector will be described in a separate file,
|                   with its boundaries being as described above for the
|                   through-hole or surface mounted component.
|
```

```
| Sub-Params:    Len, L, R, C, Fork, Endfork, Pin, Node
| Usage Rules:   Each individual connection path (user pin to node(s))
|                description begins with the [Path Description] keyword and a
|                path name, followed by the subparameters used to describe the
|                path topology and the electrical characteristics of each
|                section of the path.  The path name must not exceed 40
|                characters, blanks are not allowed, and each occurrence of the
|                [Path Description] keyword must be followed by a unique path
|                name.  Every signal pin (pins other than POWER, GND or NC)
|                must appear in one and only one path description per [Begin
|                Board Description]/[End Board Description] pair.  Pin names do
|                not have to appear in the same order as listed in the [Pin
|                List] table.  The individual subparameters are broken up into
|                those that describe the electrical properties of a section,
|                and those that describe the topology of a path.
|
|                Section Description Subparameters:
|
|                The Len, L, R, and C subparameters specify the length, the
|                series inductance, resistance, and the capacitance to ground
|                of each section in a path description.
|
|                Len      The physical length of a section.  Lengths are given
|                         in terms of arbitrary 'units'.  Any non-zero length
|                         requires that the parameters that follow must be
|                         interpreted as distributed elements by the simulator.
|                L        The series inductance of a section, in terms of
|                         'inductance/unit length'.  For example, if the total
|                         inductance of a section is 3.0 nH and the length of
|                         the section is 2 'units', the inductance would be
|                         listed as L = 1.5 nH  (i.e. 3.0 / 2).
|                C        The capacitance to ground of a section, in terms of
|                         capacitance per unit length.
|                R        The series DC (ohmic) resistance of a section, in
|                         terms of ohms per unit length.
|
|                Topology Description Subparameters:
|
|                The Fork and Endfork subparameters denote branches from the
|                main pin-to-node or pin-to-pin connection path.  The Node
|                subparameter is used to reference the pin of a component or
|                board as defined in a .ibs or .ebd file.  The Pin subparameter
|                is used to indicate the point at which a path connects to a
|                user visible pin.
|
|                Fork     This subparameter indicates that the sections
|                         following (up to the Endfork subparameter) are part
|                         of a branch off of the main connection path.  This
|                         subparameter has no arguments.
|                Endfork  This subparameter indicates the end point of a branch.
|                         For every Fork subparameter there must be a
|                         corresponding Endfork subparameter.  As with the Fork
|                         subparameter, the Endfork subparameter has no
|                         arguments.  The Fork and Endfork parameters must
|                         appear on separate lines.
|                Node     reference_designator.pin
|                         This subparameter is used when the connection path
|                         connects to a pin of another, externally defined
```

component. The arguments of the Node subparameter
indicate the pin and reference designator of the
external component. The pin and reference designator
portions of the argument are separated by a period
("."). The reference designator is mapped to an
external component description (another .ebd file or
.ibs file) by the [Reference Designator Map] Keyword.
Note that a Node MUST reference a model of a passive
or active component. A Node is not an arbitrary
connection point between two elements or paths.

Pin   This subparameter is used to mark the point at which
a path description connects to a user accessible pin.
Every path description must contain at least one
occurrence of the Pin subparameter. It may also
contain the reserved word NC. The value of the Pin
subparameter must be one of the pin names listed in
the [Pin List] section.

Note: The reserved word NC can also be used in path descriptions
in a similar manner as the subparameters in order to terminate
paths. This usage is optional.

Using The Subparameters to Describe Paths:

A section description begins with the Len subparameter and
ends with the slash (/) character. The value of the Len, L,
R, and C subparameters and the subparameter itself are
separated by an equals sign (=); white space around the equals
sign is optional. The Fork, Endfork, Node and Pin
subparameters are placed between section descriptions (i.e.,
between the concluding slash of one section and the 'Len'
parameters that starts another). The arguments of the Pin and
Node subparameter are separated by white space.

Specifying a Len or L/R/C value of zero is allowed. If
Len = 0 is specified, then the L/R/C values are the total for
that section. If a non-zero length is specified, then the
total L/R/C for a section is calculated by multiplying the
value of the Len subparameter by the value of the L, R, or C
subparameter. However, as noted below, if a non-zero length
is specified, that section MUST be interpreted as distributed
elements.

Legal Subparameter Combinations for Section Descriptions:

A) Len, and one or more of the L, R and C subparameters. If
the Len subparameter is given as zero, then the L/R/C
subparameters represent lumped elements. If the Len
subparameter is non-zero, then the L/R/C subparameters
represent distributed elements and both L and C must be
specified, R is optional. The segment Len ..../ must
not be split; the whole segment must be on one line.

B) The first subparameter following the [Path Description]
keyword must be 'Pin', followed by one or more section
descriptions. The path description can terminate in a Node,
another pin or the reserved word, NC. However, NC may be
optionally omitted.

```
|
|                   Dealing With Series Elements:
|
|                   A discrete series R or L component can be included in a path
|                   description by defining a section with Len=0 and the proper R
|                   or L value.  A discrete series component can also be included
|                   in a path description by writing two back to back node
|                   statements that reference the same component (see the example
|                   below).  Note that both ends of a discrete, two terminal
|                   component MUST be contained in a single [Path Description].
|                   Connecting two separate [Path Description]s with a series
|                   component is not allowed.
|-----------------------------------------------------------------------------
|   An Example Path For a SIMM Module:

 |=============================================================================
 |     Keyword:   [Reference Designator Map]
 |    Required:   Yes, if any of the path descriptions use the Node subparameter
 | Description:   Maps a reference designator to a component or electrical board
 |                description contained in an .ibs or .ebd file.
 | Usage Rules:   The [Reference Designator Map] keyword must be followed by a
 |                list of all of the reference designators called out by the
 |                Node subparameters used in the various path descriptions.
 |                Each reference designator is followed by the name of the .ibs
 |                or .ebd file containing the electrical description of the
 |                component or board, then the name of the component itself as
 |                given by the .ibs or .ebd file's [Component] or [Begin Board
```

```
|                   Description] keyword respectively.  The reference designator,
|                   file name and component name terms are separated by white
|                   space.  By default the .ibs or .ebd files are assumed to exist
|                   in the same directory as the calling .ebd file. It is legal
|                   for a reference designator to point to a component that is
|                   contained in the calling .ebd file.
|
|                   The reference designator is limited to ten characters.

|==============================================================================
|
| This section explains how data values are derived.  It describes certain
| assumed parameter and table extraction conditions if they are not explicitly
| specified.  It also describes the allocation of data into the "typ", "min",
| and "max" columns under variations of voltage, temperature, and process.
|
| The required "typ" column for all data represents typical operating
| conditions.  For most [Model] keyword data, the "min" column describes slow,
| weak performance, and  the "max" column describes the fast, strong
| performance.  It is permissible to use slow, weak components or models to
| derive the data for the "min" column, and to use fast, strong components or
| models to derive the data in the "max" columns under the corresponding
| voltage and temperature derating conditions for these columns.  It is also
| permissible to use typical components or models derated by voltage and
| temperature and optionally apply proprietary "X%" and "Y%" factors described
| later for further derating.  This methodology has the nice feature that the
| data can be derived either from semiconductor vendor proprietary models, or
| typical component measurement over temperature/voltage.
|
| The voltage and temperature keywords and optionally the process models
| control the conditions that define the "typ", "min", and "max" column
| entries for all I-V table keywords [Pulldown], [Pullup], [GND Clamp], and
| [POWER Clamp]; all [Ramp] subparameters dV/dt_r and dV/dt_f; and all
| waveform table keywords and subparameters [Rising Waveform], [Falling
| Waveform], V_fixture, V_fixture_min, and V_fixture_max.
|
| The voltage keywords that control the voltage conditions are [Voltage
| Range], [Pulldown Reference], [Pullup Reference], [GND Clamp Reference], and
| [POWER Clamp Reference].  The entries in the "min" columns contain the
| smallest magnitude voltages, and the entries in the "max" columns contain
| the largest magnitude voltages.
|
| The optional [Temperature Range] keyword will contain the temperature which
| causes or amplifies the slow, weak conditions in the "min" column and the
| temperature which causes or amplifies the fast, strong conditions in the
| "max" column.  Therefore, the "min" column for [Temperature Range] will
| contain the lowest value for bipolar models (TTL and ECL) and the highest
| value for CMOS models.  Default values described later are assumed if
| temperature is not specified.
|
| The "min" and "max" columns for all remaining keywords and subparameters
| will contain the smallest and largest magnitude values.  This applies to the
| [Model] subparameter C_comp as well even if the correlation to the voltage,
| temperature, and process variations are known because information about such
| correlation is not available in all cases.
|
| C_comp is considered an independent variable.  This is because C_comp
| includes bonding pad capacitance, which does not necessarily track
| fabrication process variations.  The conservative approach to using IBIS
```

data will associate large C_comp values with slow, weak models, and the
small C_comp values with fast, strong models.

The default temperatures under which all I-V tables are extracted are
provided below. The same defaults also are stated for the [Ramp]
subparameters, but they also apply for the waveform keywords.

The stated voltage ranges for I-V tables cover the most common, single
supply cases. When multiple supplies are specified, the voltages shall
extend similarly to values that handle practical extremes in reflected wave
simulations.

For the [Ramp] subparameters, the default test load and voltages are
provided. However, the test load can be entered directly by the R_load
subparameter. The allowable test loads and voltages for the waveform
keywords are stated by required and optional subparameters; no defaults are
needed. Even with waveform keywords, the [Ramp] keyword continues to be
required so that the IBIS model remains functional in situations which do
not support waveform processing.

The following discussion lists test details and default conditions.

1) I-V Tables:
   I-V tables for CMOS models:
      typ = typical voltage, typical temp deg C, typical process
      min = minimum voltage, max temp deg C, typical process, minus "X%"
      max = maximum voltage, min temp deg C, typical process, plus "X%"

   I-V tables for bipolar models:
      typ = typical voltage, typical temp deg C, typical process
      min = minimum voltage, min temp deg C, typical process, minus "X%"
      max = maximum voltage, max temp deg C, typical process, plus "X%"

   Nominal, min, and max temperature are specified by the semiconductor
   vendor. The default range is 50 deg C nom, 0 deg C min, and 100 deg C
   max temperatures.

   X% should be statistically determined by the semiconductor vendor based
   on numerous fab lots, test chips, process controls, etc.. The value of X
   need not be published in the IBIS file, and may decrease over time as
   data on the I/O buffers and silicon process increases.

   Temperatures are junction temperatures.

2) Voltage Ranges:
   Points for each table must span the voltages listed below:

      Table   Low Voltage   High Voltage
      -----------   -----------   ------------
      [Pulldown]   GND - POWER   POWER + POWER
      [Pullup]   GND - POWER   POWER + POWER
      [GND Clamp]   GND - POWER   GND + POWER
      [POWER Clamp]   POWER   POWER + POWER
      [Series Current]   GND - POWER   GND + POWER
      [Series MOSFET]   GND   GND + POWER

   As described in the [Pulldown Reference] keyword section, the I-V tables
   of the [Pullup] and the [POWER Clamp] structures are 'Vcc relative',

using the equation: Vtable = Vcc - Voutput.

For example, a model with a 5 V power supply voltage should be
characterized between (0 - 5) = -5 V and (5 + 5) = 10 V; and a model with
a 3.3 V power supply should be characterized between (0 - 3.3) = -3.3 V
and (3.3 + 3.3) = 6.6 V for the [Pulldown] table.

When tabulating output data for ECL type models, the voltage points must
span the range of Vcc to Vcc - 2.2 V. This range applies to both the
[Pullup] and [Pulldown] tables. Note that this range applies ONLY when
characterizing an ECL output.

These voltage ranges must be spanned by the IBIS data. Data derived from
lab measurements may not be able to span these ranges as such and so may
need to be extrapolated to cover the full range. This data must not be
left for the simulator to provide.

3) Ramp Rates:
   The following steps assume that the default load resistance of 50 ohms is
   used. There may be models that will not drive a load of only 50 ohms
   into any useful level of dynamics. In these cases, use the semiconductor
   vendor's suggested (nonreactive) load and add the load subparameter to
   the [Ramp] specification.

   The ramp rate does not include packaging but does include the effects of
   the C_comp parameter; it is the intrinsic output stage rise and fall time
   only.

   The ramp rates (listed in AC characteristics below) should be derived as
   follows:

   a. If starting with the silicon model, remove all packaging. If starting
      with a packaged model, perform the measurements as outlined below.
      Then use whatever techniques are appropriate to derive the actual,
      unloaded rise and fall times.

   b. If: The Model_type is one of the following: Output, I/O, or 3-state
          (not open or ECL types);
          Then: Attach a 50 ohm resistor to GND to derive the rising edge
                ramp. Attach a 50 ohm resistor to POWER to derive the
                falling edge ramp.

      If: The Model_type is Output_ECL, I/O_ECL, 3-state_ECL;
          Then: Attach a 50 ohm resistor to the termination voltage
                (Vterm = VCC - 2 V). Use this load to derive both the
                rising and falling edges.

      If: The Model_type is either an Open_sink type or Open_drain type;
          Then: Attach either a 50 ohm resistor or the semiconductor vendor
                suggested termination resistance to either POWER or the
                suggested termination voltage. Use this load to derive both
                the rising and falling edges.

      If: The Model_type is an Open_source type;
          Then: Attach either a 50 ohm resistor or the semiconductor vendor
                suggested termination resistance to either GND or the
                suggested termination voltage. Use this load to derive both
                the rising and falling edges.

c. Due to the resistor, output swings will not make a full transition as
       expected. However the pertinent data can still be collected as
       follows:
            1) Determine the 20% to 80% voltages of the 50 ohm swing.
            2) Measure this voltage change as "dV".
            3) Measure the amount of time required to make this swing "dt".

    d. Post the value as a ratio "dV/dt". The simulator extrapolates this
       value to span the required voltage swing range in the final model.

    e. Typ, Min, and Max must all be posted, and are derived at the same
       extremes as the I-V tables, which are:

       Ramp rates for CMOS models:
          typ = typical voltage, typical temp deg C, typical process
          min = minimum voltage, max temp deg C, typical process, minus "Y%"
          max = maximum voltage, min temp deg C, typical process, plus "Y%"

       Ramp rates for bipolar models:
          typ = typical voltage, typical temp deg C, typical process
          min = minimum voltage, min temp deg C, typical process, minus "Y%"
          max = maximum voltage, max temp deg C, typical process, plus "Y%"

       where nominal, min, and max temp are specified by the semiconductor
       vendor. The preferred range is 50 deg C nom, 0 deg C min, and
       100 deg C max temperatures.

       Note that the derate factor, "Y%", may be different than that used for
       the I-V table data. This factor is similar to the X% factor described
       above. As in the case of I-V tables, temperatures are junction
       temperatures.

    f. During the I-V measurements, the driving waveform should have a
       rise/fall time fast enough to avoid thermal feedback. The specific
       choice of sweep time is left to the modeling engineer.

4) Transit Time Extractions:
   The transit time parameter is indirectly derived to be the value that
   produces the same effect as that extracted by the reference measurement
   or reference simulation.

   The test circuit consists of the following:
   a) A pulse source (10 ohms, 1 ns at full duration ramp) or equivalent and
      transitioning between Vcc and 0 V,
   b) A 50 ohm, 1 ns long trace or transmission line,
   c) A 500 ohm termination to the ground clamp reference voltage for TTgnd
      extraction and to the power clamp reference voltage for TTpower
      extraction (to provide a convenient, minimum loading 450 ohm - 50 ohm
      divider for high-speed sampling equipment observation of the component
      denoted as the device under test), and
   d) The device under test (DUT).

```
                                                DUT with [GND Clamp]
                        _____          | /|
            o---/\/\/\--O_____)---o--|<  |--o GND
              10 ohms      Z0 = 50 ohm    |   | \|   |
                          TD = 1 ns       |   |       |
                                          |-/\/\/\-|
                                          | 500 ohm Load for Probing
      Vcc ---\            ------\          |
             \                 \       o       /--\
      0 V     \------           \     /      \-------
             | |                 \---------/
            1 ns                 |<----------->|
         1 ns, 10 ohm         Choose TTgnd that matches the measured
         Source Signal        delay with the IBIS model simulation delay

                    Example of TTgnd Extraction Setup
```

The TTgnd extraction will be done only if a [GND Clamp] table exists. A
high to low transition that produces a positive "glitch", perhaps several
nanoseconds later indicates a stored charge in the ground clamp circuit.
The test circuit is simulated using the complete IBIS model with C_comp
and the Ct model defined under the [TTgnd] and [TTpower] keywords. An
effective TTgnd value that produces a "glitch" with the same delay is
extracted.

Similarly, the TTpower extraction will be done only if a [POWER Clamp]
table exists. A low to high transition that produces a negative
"glitch", perhaps several nanoseconds later indicates a stored charge in
the power clamp circuit. An effective TTpower value that produces a
glitch with the same delay is extracted.

It is preferred to do the extractions with the package parameters
removed. However, if the extraction is done from measurements, then the
package model should be included in the IBIS based simulation.

5) Series MOSFET Table Extractions:
   An extraction circuit is set up according to the figure below. The
   switch is configured into the 'On' state. This assumes that the Vcc
   voltage will be applied to the gate by internal logic. Designate one pin
   of the switch as the source node, and the other pin as the drain node.
   The Table Currents designated as Ids are derived directly as a function
   of the Vs voltage at the source node as Vs is varied from 0 to Vcc. This
   voltage is entered as a Vgs value as a consequence of the relationship
   Vtable = Vgs = Vcc - Vs. Vds is held constant by having a fixed voltage
   Vds between the drain and source nodes. Note, Vds > 0 V. The current
   flowing into the drain is tabulated in the table for the corresponding Vs
   points.

```
|            +-----------------------------------------+
|            |                                         |
|            |                Ids = Table Current      |
|            |                    --->                 |
|        +---<---|       |--->----------+              |
|          d     |_____| - s            | +            |
|             --+-- Vgs           +---+---+  +----+----+
|              | g  +             | Sweep |  |  Vs +   |
|                                 |   Vs  |  |Fixed Vds|
|                                 +---+---+  +----+----+
|                                     | -         |
|                                    GND         GND
|
|            Example of Series MOSFET Table Extraction
|
| It is expected that this data will be created from semiconductor vendor
| proprietary silicon models, and later correlated with actual component
| measurement.
|
