

Simpler Redriver Flow

Does Not Need New Reserved Parameter

No Change To AMI_Init Signature

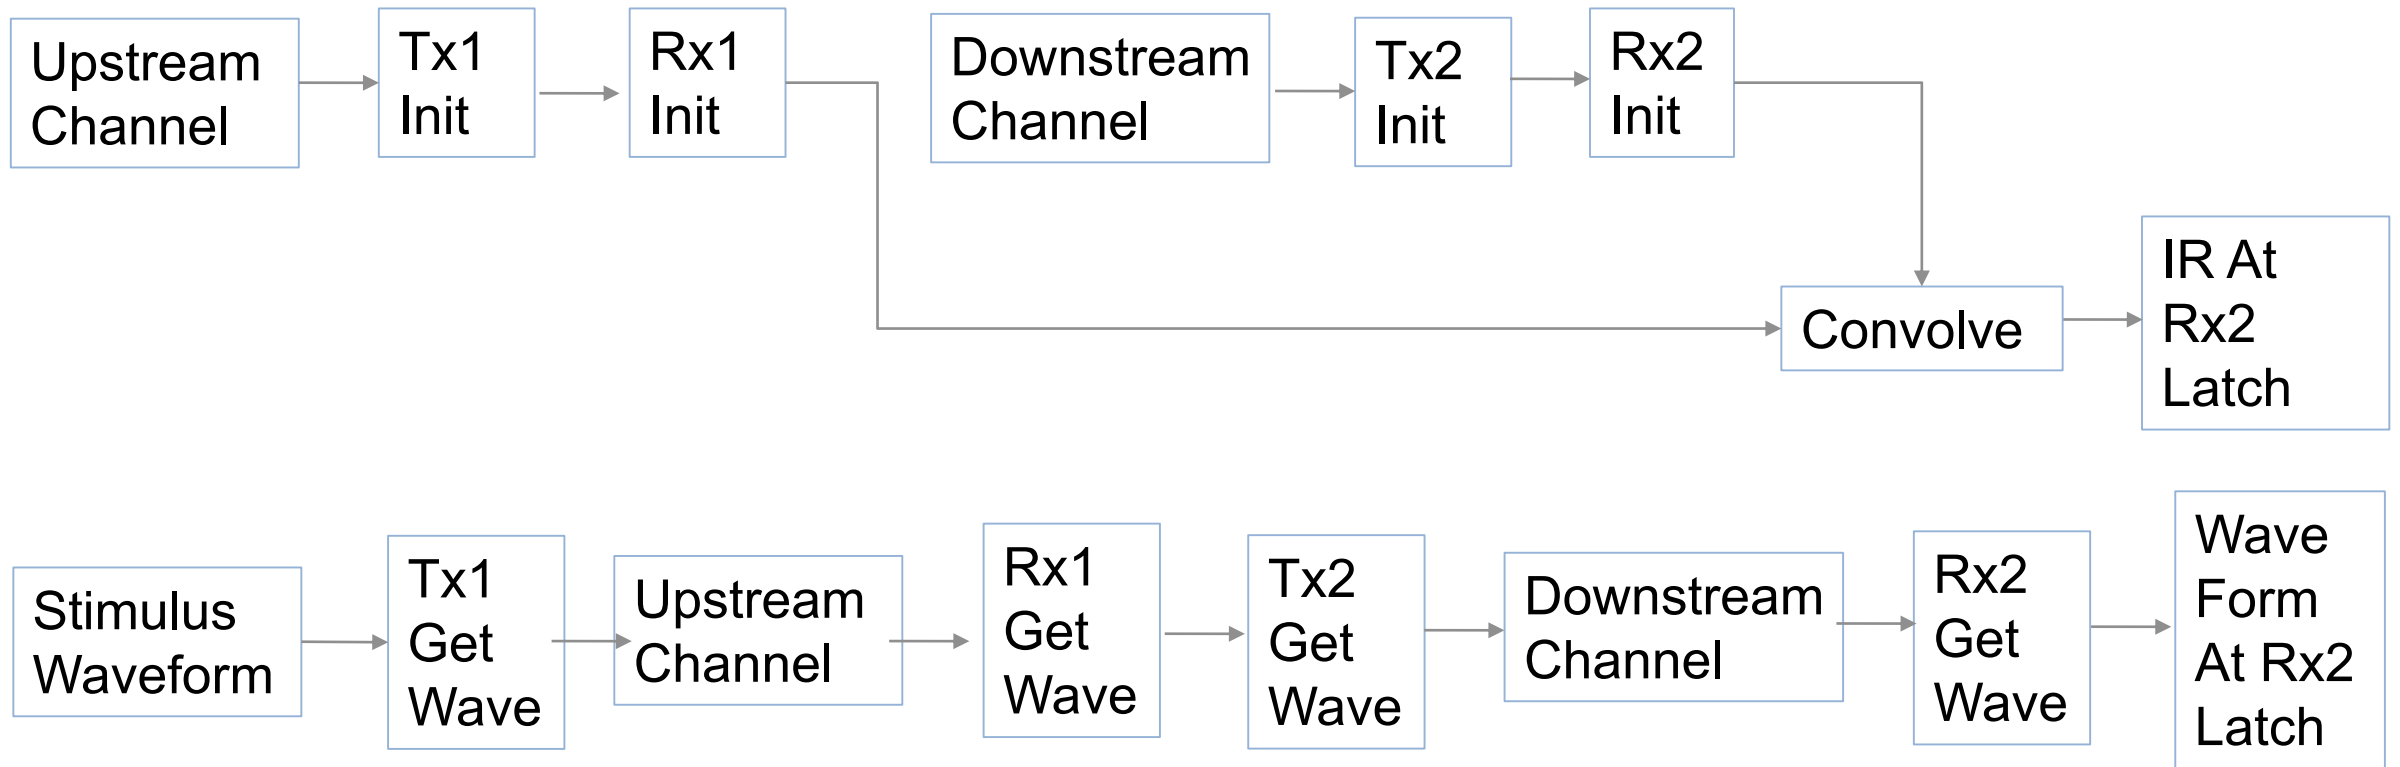

No Change To AMI Model Generation Tools

Current IBIS Redriver Flow

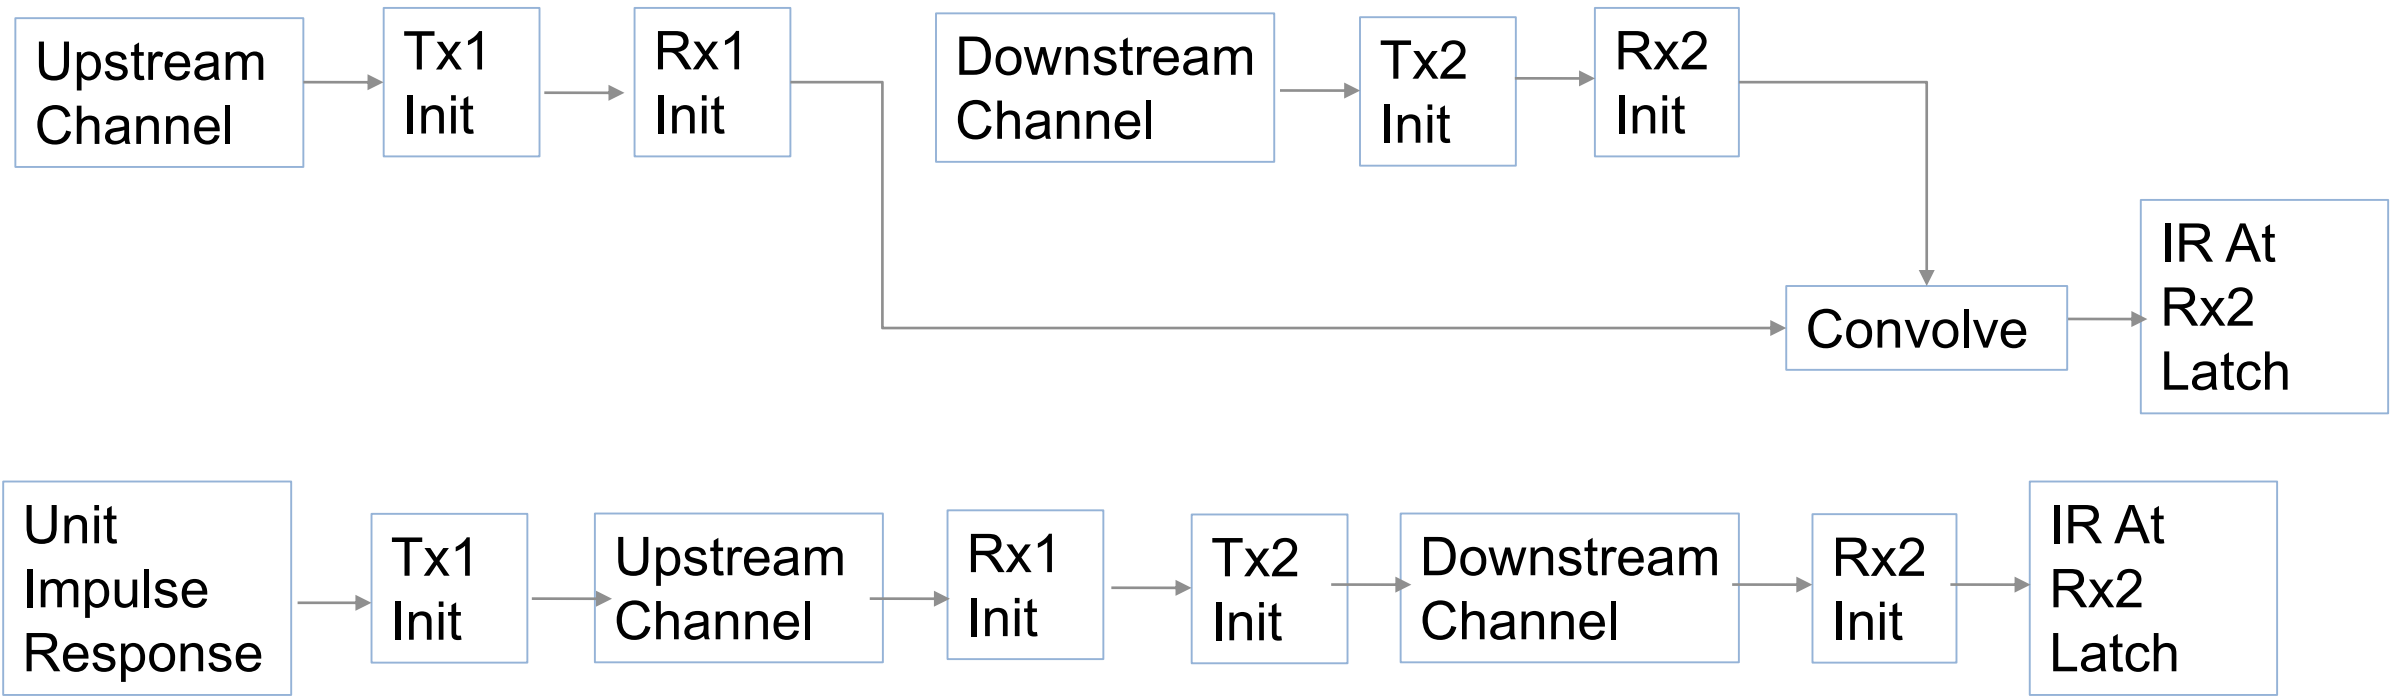

Column 1 of Impulse Matrix, and GetWave Flow

Old Init Flow and BIRD 166

Fangyi IBIS Redriver Flow BIRD210:
 New AMI Reserved Parameter Use_IBIS7.1_Flow
 Column 1 of Impulse Matrix; First New column of Impulse Matrix
 Second New Column Returns Impulse Response of Equalization

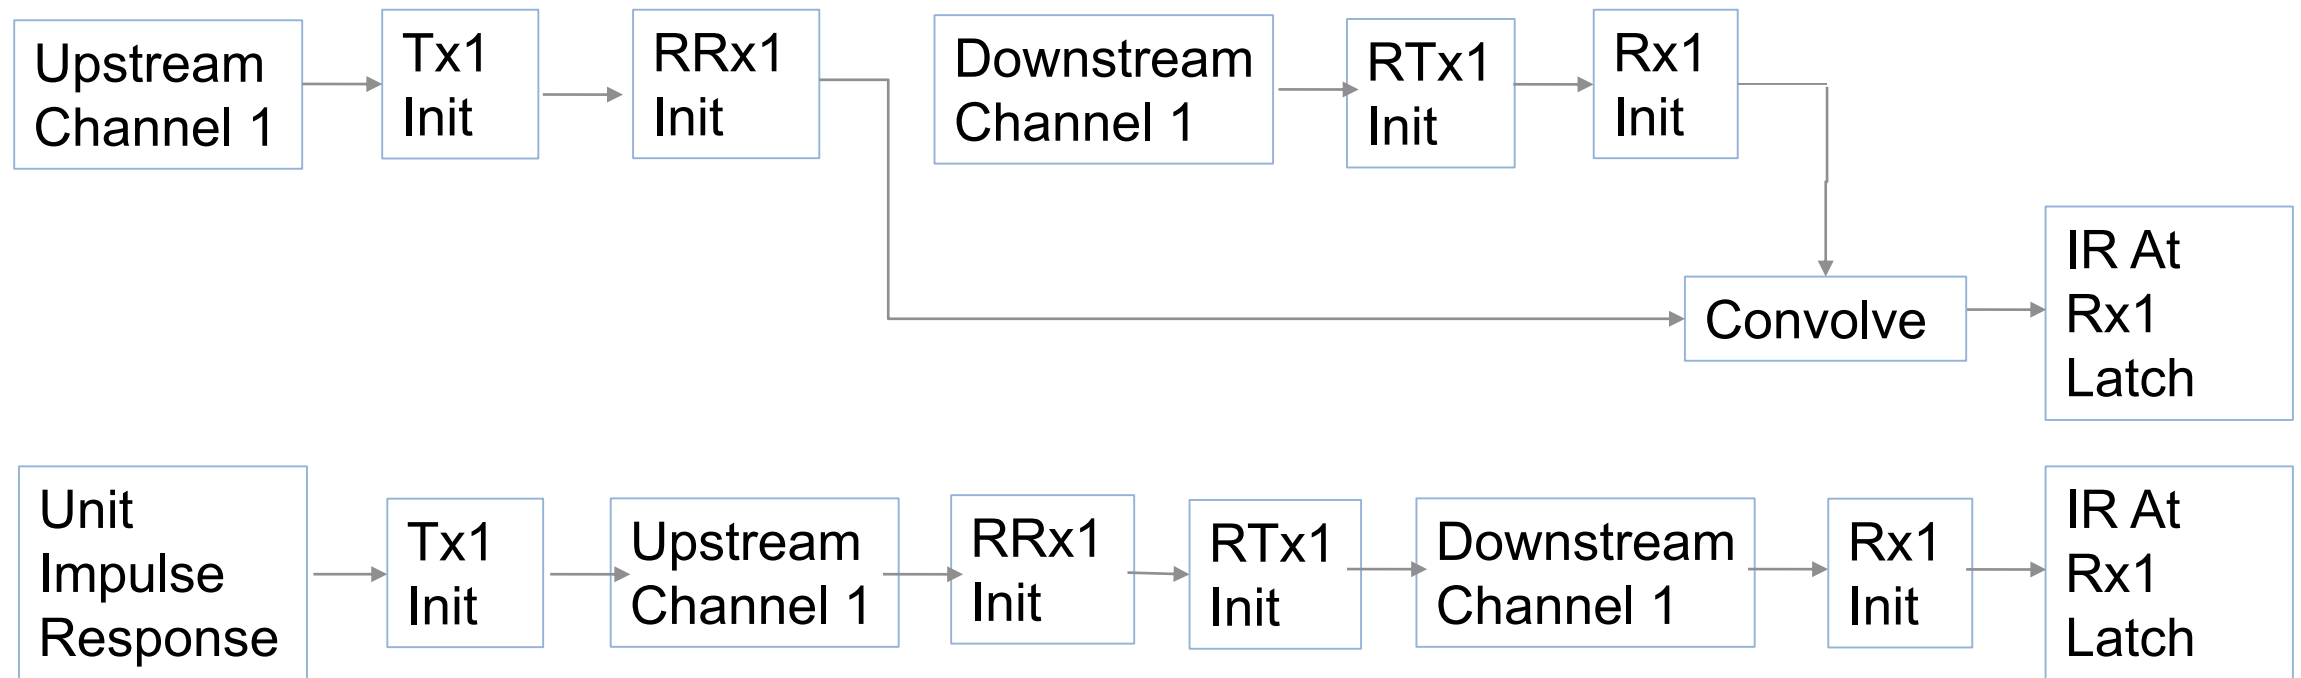

There Is No Need To Add The New Reserved Parameter Use_IBIS7.1_Flow To Use The New Flow For Any Existing Model That Has Init_Returns_Impulse=True

- The EDA tool is free to add one or two columns to the Impulse Matrix
- The AMI_Init function is expected to convolve the LTI part (equalization except for DFE) of its equalization to each aggressor column of the Impulse Matrix.
- The EDA tool can add a column that is initialized to a Unit Impulse Response, then that column in the Impulse Matrix output will be the LTI part of the equalization. This can be used to eliminate deconvolution for Init Only models in time domain simulations.
- The EDA tool can choose to use column, or add a column to the Impulse Matrix that follows the flow as indicated in the slide above.

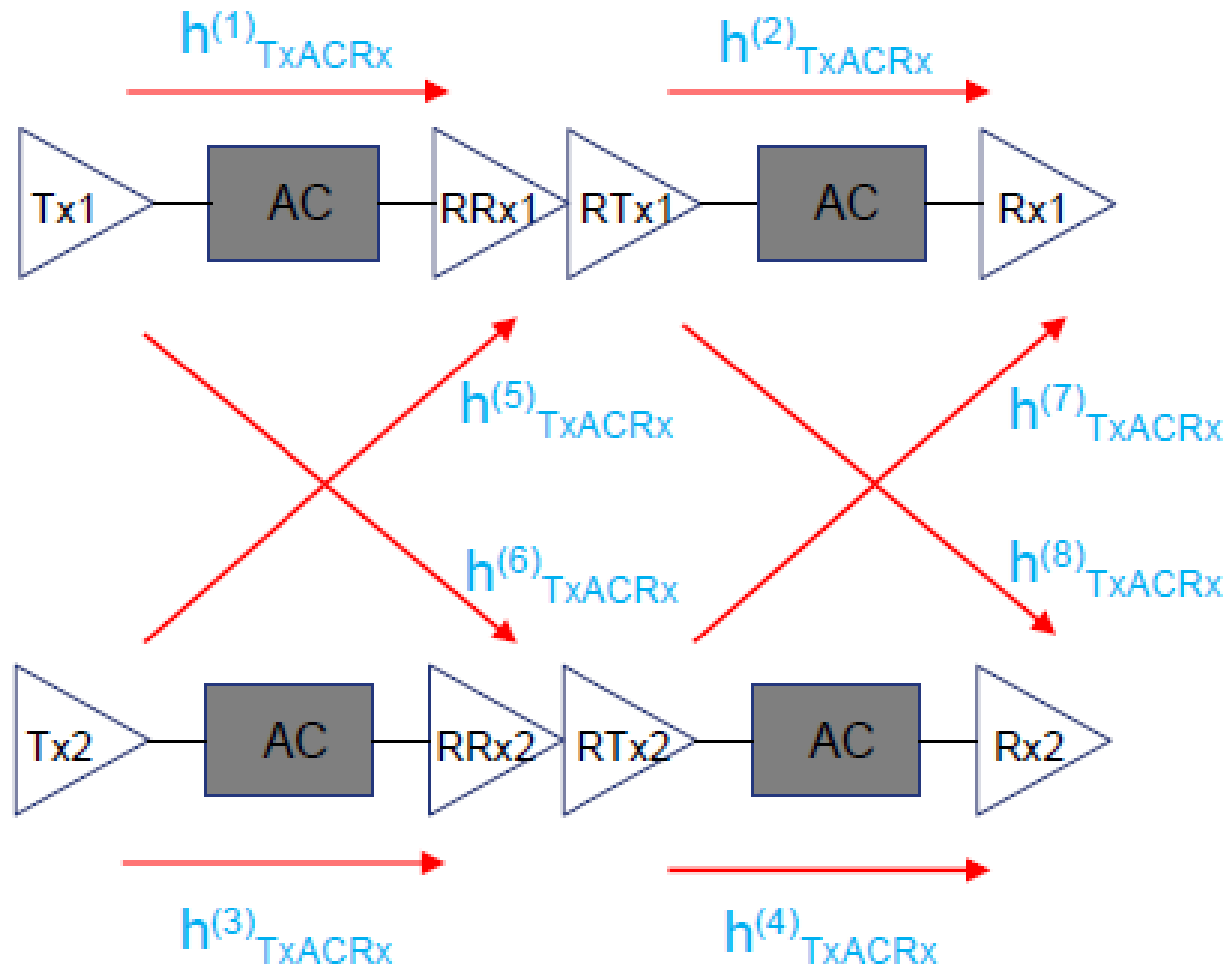

Proposed Redriver Flow BIRD "211" or 166.5 or 210.1

Replace Column 1 With Proposed Channel Column

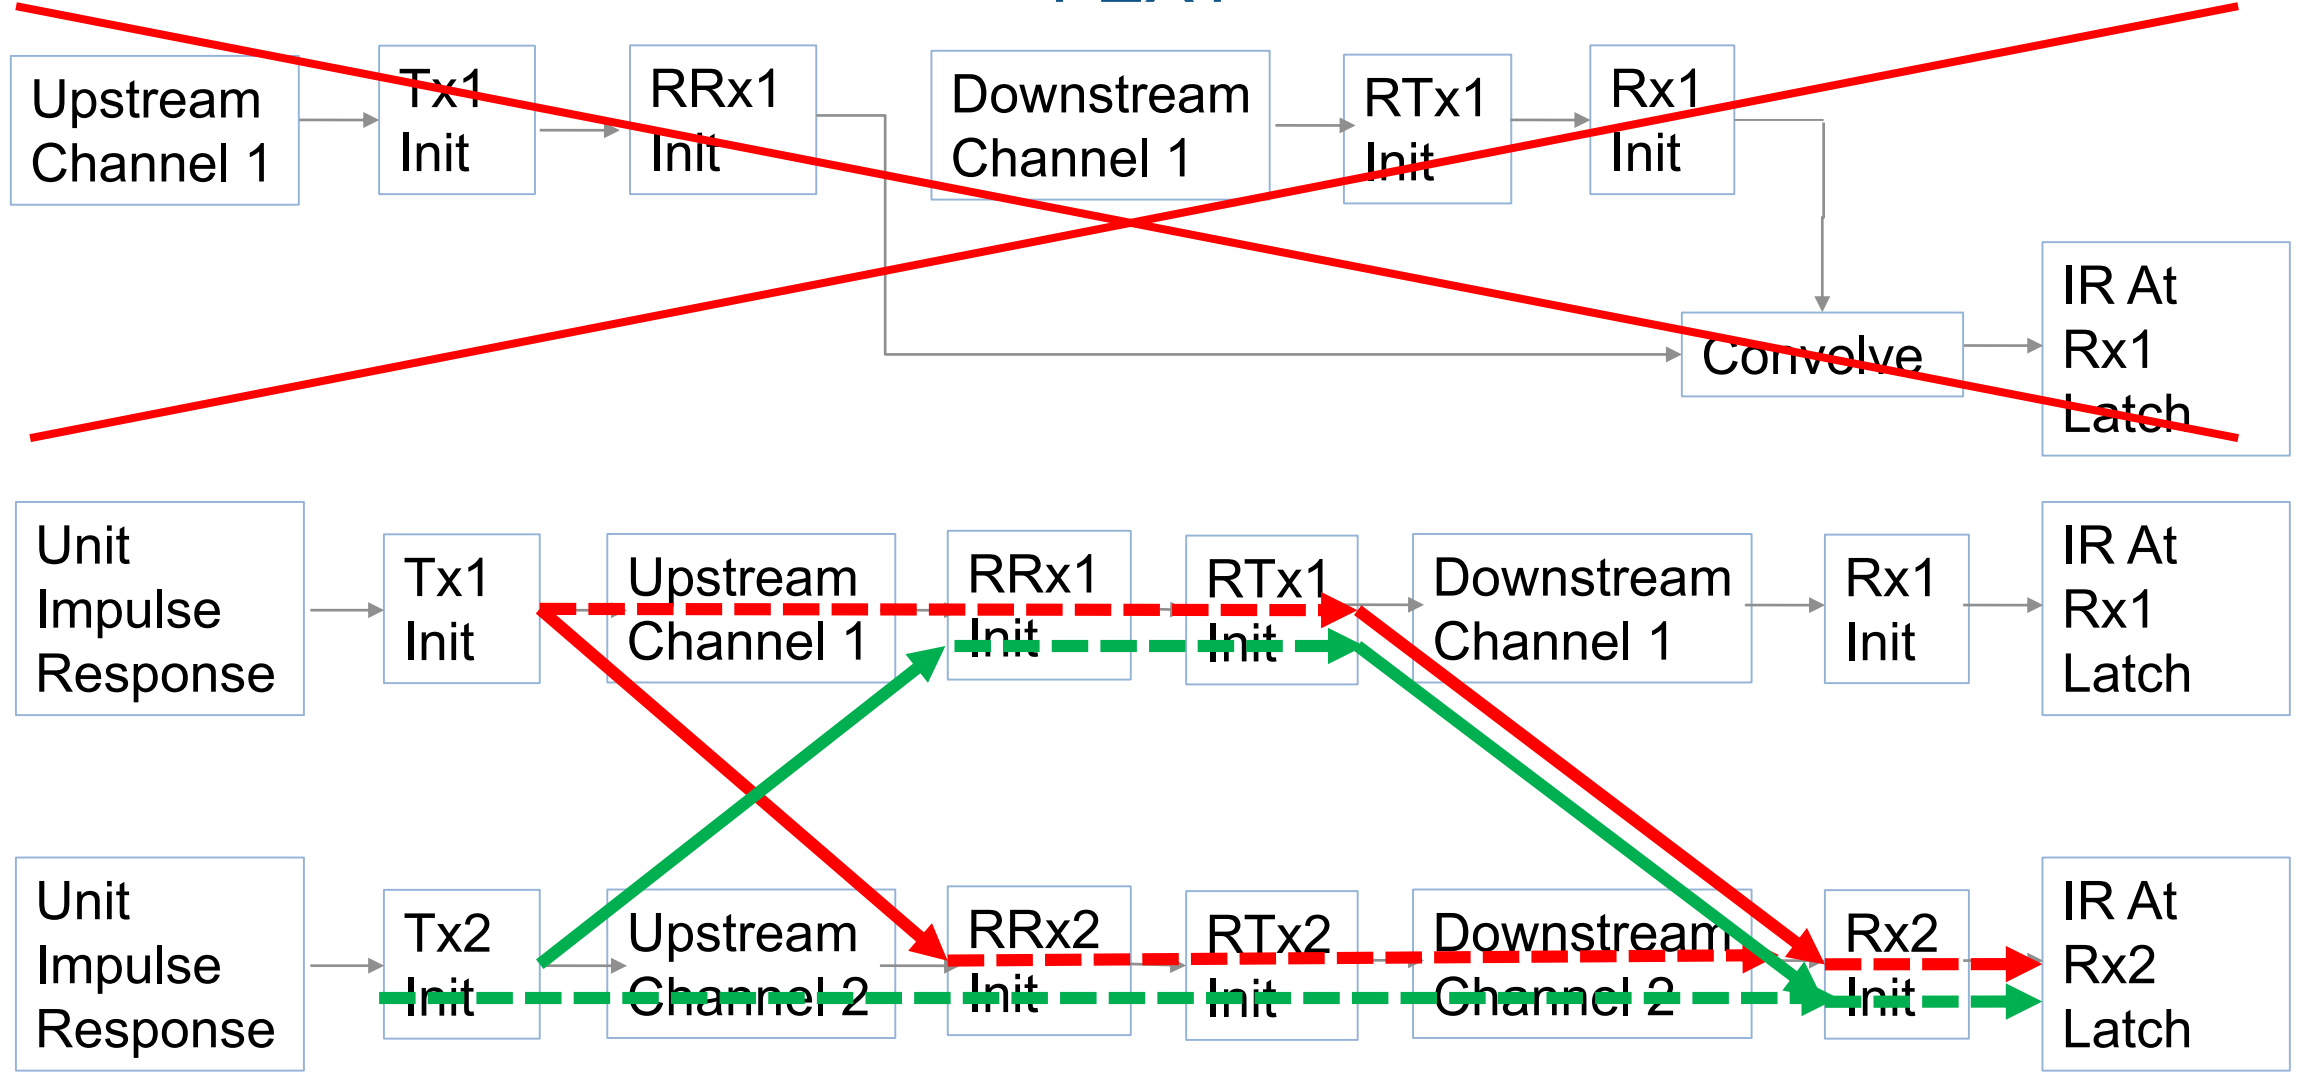

No New Reserved Parameter

Proper Way To Do Crosstalk. From Fangyi Presentation

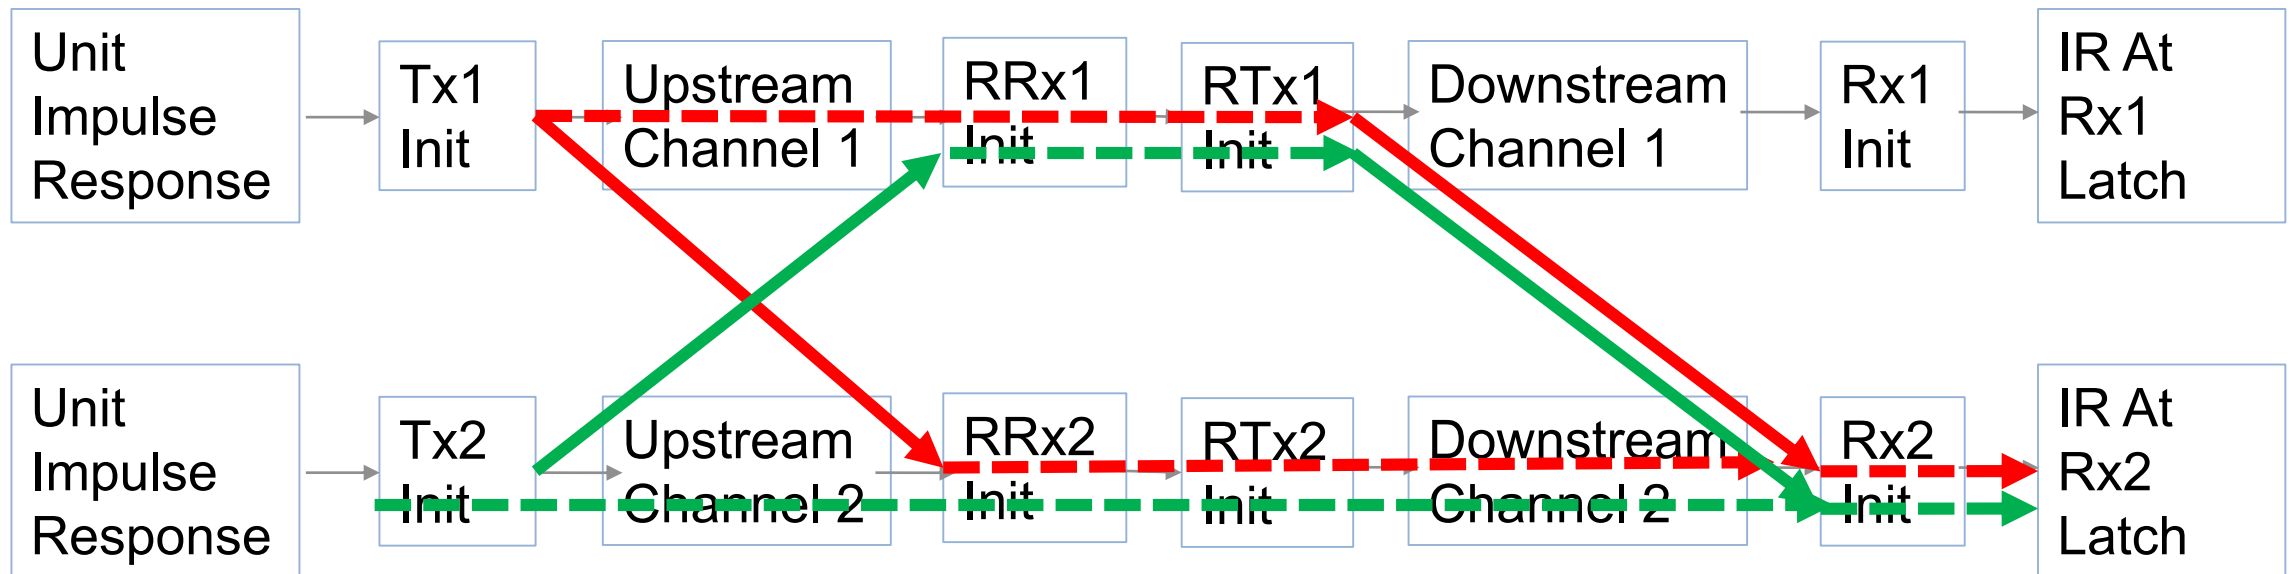

Showing All Crosstalk From Channel 1 Tx to Channel 2 Rx FEXT

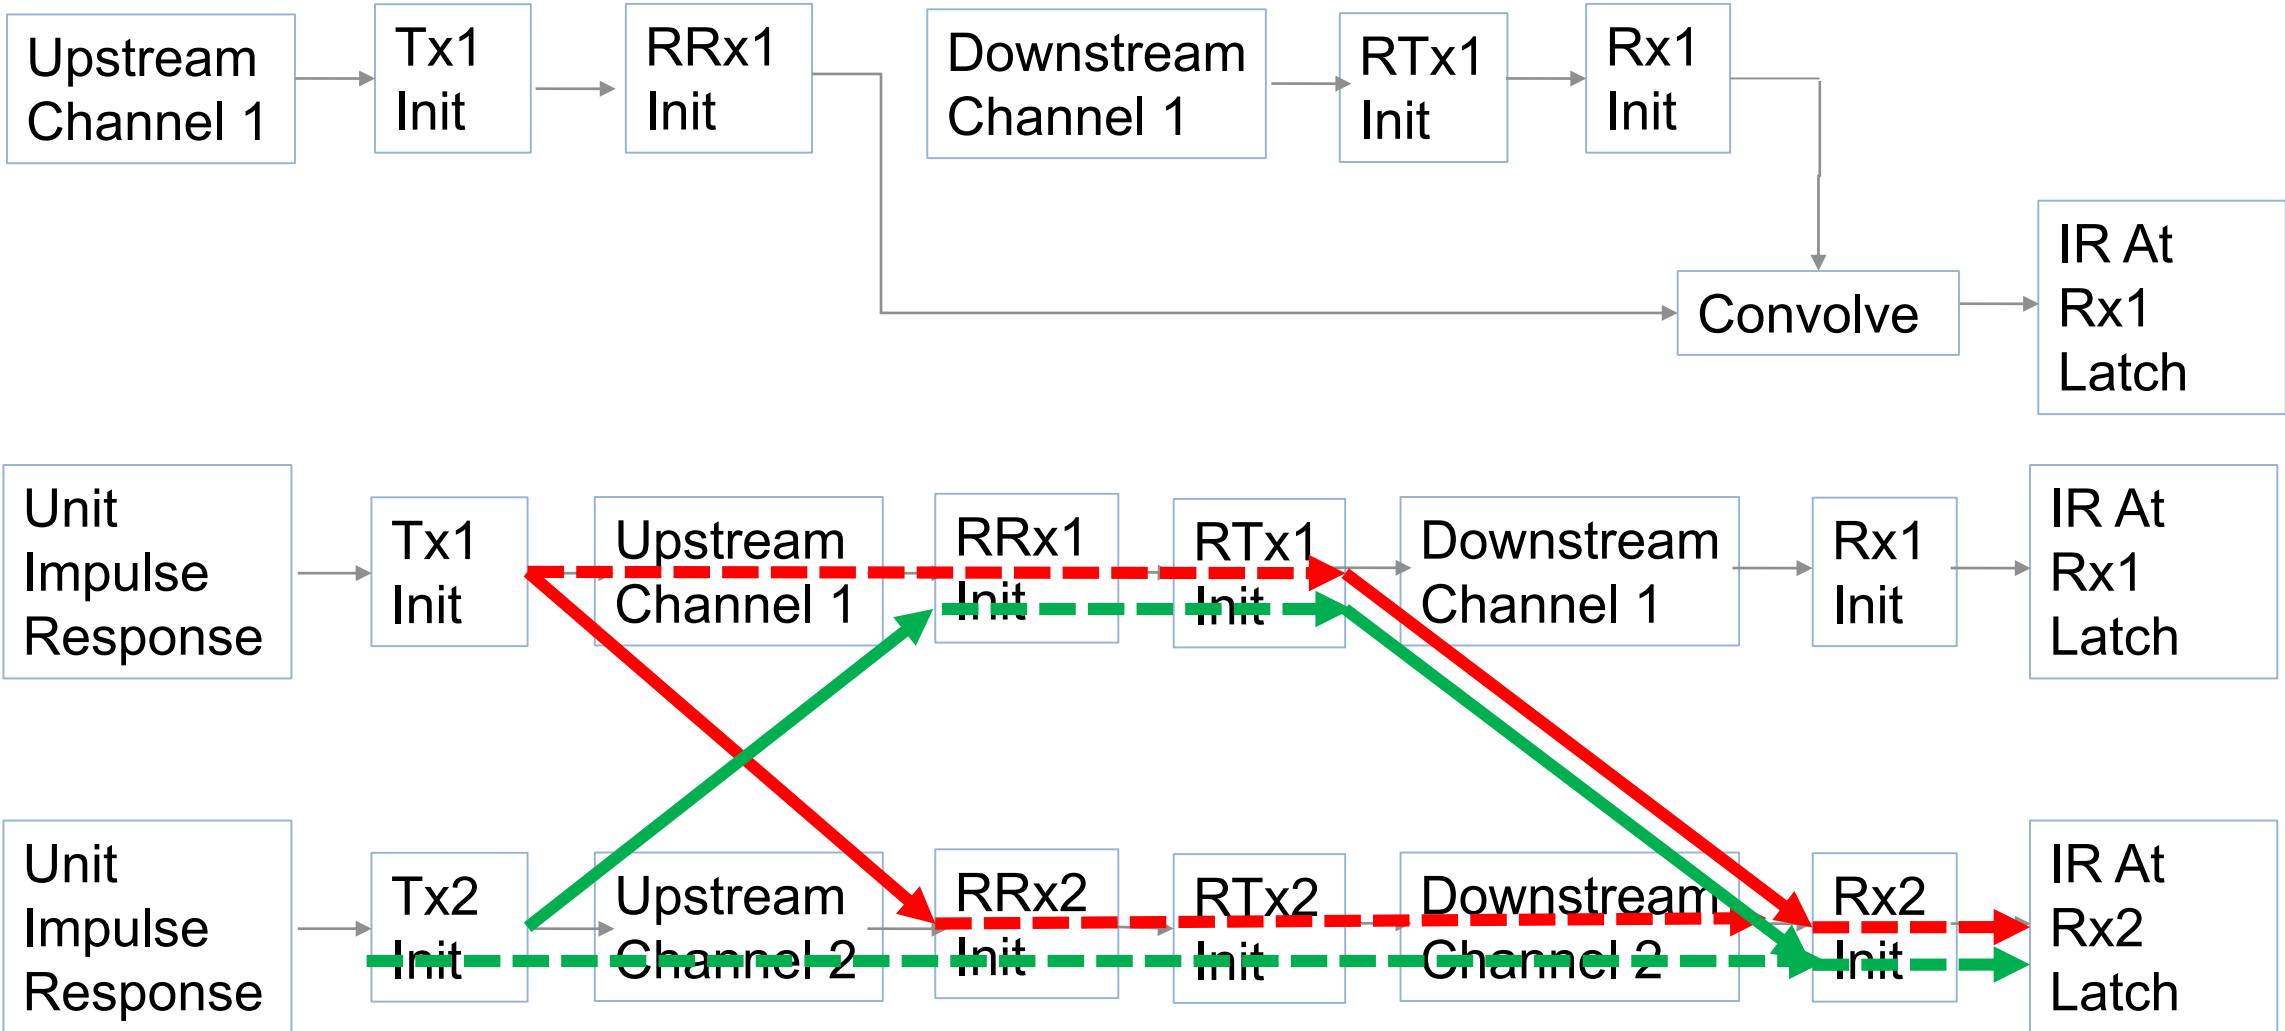

The Task Is To Document How Create The Impulse Matrix (2 Columns) At Rx2 Init

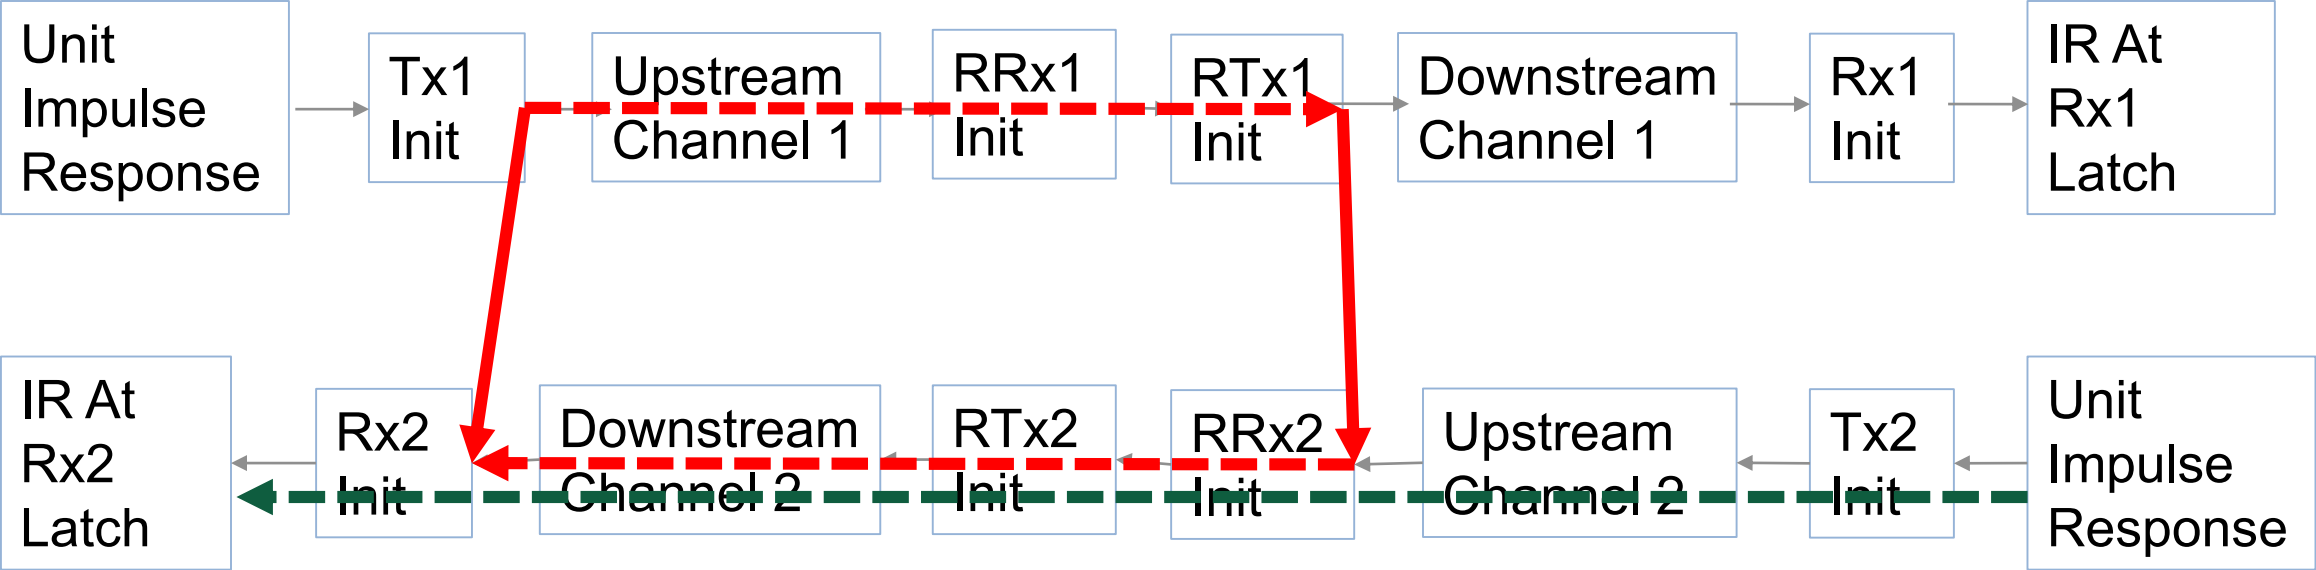

Solid Lines Are Convolutions By EDA Tool
 Dashed Lines Are Convolutions By Model
 IR At Same Color Arrows Are Added Together

There Is No Need For These Two Impulse Response Columns

Showing All Crosstalk From Channel 1 Tx to Channel 2 Rx NEXT

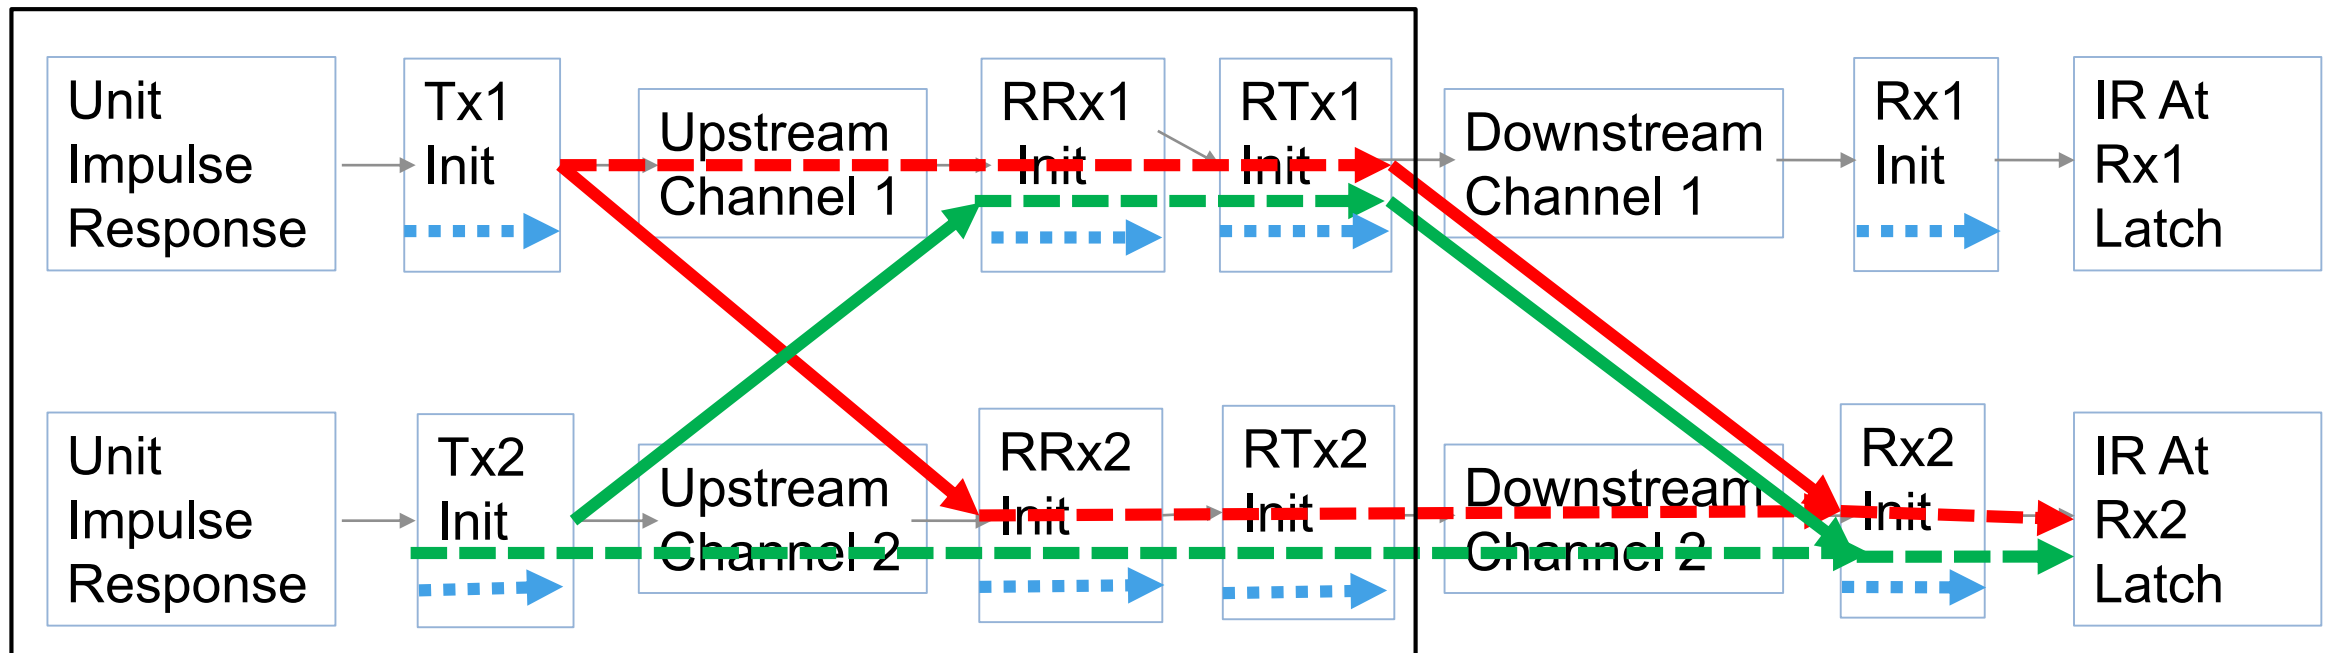

An Even Simpler Approach Is To Run The Init Flow On All Through Channels Using One Aggressor Column To Generate Model Equalization

Run the through channel on all transfers from primary Tx up to terminal Rx

The second column of the Impulse Matrix input is always unit impulse response

All of the crosstalk paths are then calculated and combined at the input to the terminal Rx

Then the terminal Rx's are executed.

Recommendations

1. Change the Redriver Flow (as shown in slide 1.)
2. Let EDA tools handle crosstalk at their discretion
3. Note that Init Only models do not require deconvolution to emulate the missing `AMI_GetWave` function
4. For all of this to work, all models require that all the Init functions return a modified impulse response. The terminal Rx needs to get the correct impulse response output for the crosstalk columns (equalization without DFE).

Conclusions

- Proposed flow does not require a new reserved parameter.
- Proposed flow works perfectly well with legacy models.
- All models should have `Init_Returns_Impulse=True`
- Deconvolution is eliminated by the EDA tool adding an additional column initialized to a unit impulse response. This works on any legacy model that has `Init_Returns_Impulse=True`
- No need to change any AMI Model generation tools
